3 (by Zoom webinar)

4 **THE CLERK:** Calling civil action 19-001, Zoho  
5 Corporation versus Sentius International.

6 Counsel, please state your appearances.

7 **THE COURT:** For Zoho?

8 **MR. MARTON:** Ryan Marton for Zoho. With me is Phil  
9 Haack for Zoho.

10 **THE COURT:** Okay. And for Sentius?

11 **MR. YORIO:** Robert Yorio and Sandeep Seth for  
12 Sentius, Your Honor.

13 **THE COURT:** All right. Good morning, everyone.

14 Let's just make sure that we understand the terms that --  
15 the order of the terms. So are we starting with "beginning  
16 position address of a textual source material"?

17 **MR. MARTON:** Yes, Your Honor.

18 **THE COURT:** And --

19 **MR. YORIO:** I summarize the conferences that we've  
20 had with counsel.

21 (Simultaneous colloquy.)

22 **MR. YORIO:** The order that the terms will be  
23 addressed in argument is the same as you see it in the slides,  
24 same order as in the joint claim construction statement and  
25 the briefs.

1           **THE COURT:** Okay. So --

2           **MR. YORIO:** '633 patent terms will come first. The  
3 three '985 patent terms will come last. We have discussed  
4 reserving enough time so the last three terms don't get  
5 rushed, and we're going to try to -- to reserve about 45 to 50  
6 minutes for those final three terms.

7           **THE COURT:** Okay.

8           And -- well, let's are -- have you split up the argument  
9 between the four of you? Or is there just going to be two  
10 people that I'm addressing here?

11           **MR. YORIO:** On the Sentius side, Mr. Seth and I will  
12 split the terms.

13           **THE COURT:** All right. Mr. Marton, how about on your  
14 side?

15           **MR. MARTON:** Yes. We will be splitting up the  
16 argument. I'll be doing the '633 terms, and Phil Haack will  
17 be doing the '985 terms.

18           **THE COURT:** All right. Well, then let's start at the  
19 beginning, that being the "beginning address" -- the  
20 "beginning position address of a textual source material."

21           Zoho's position first is that there was no construction  
22 needed so Sentius may begin.

23           **MR. SETH:** Sorry. Let me unmute.

24           I'll be handling this term, Your Honor.

25           Now, with regard to this term, there's a -- a number of

1 things that have, I think, become clear over the course of  
2 this litigation and the tutorial, and that is that neither  
3 side disputes that the way visual editors work is character  
4 position by character position.

5 And the invention of the '633 patent is to take advantage  
6 of the mapping between the display address -- the undisputed  
7 mapping I should say between the display address and the  
8 character position that all visual editors have so that Your  
9 Honor or myself or anybody using the visual editor can go to a  
10 particular location on the screen and then add a character,  
11 delete a character, add a string of characters to form a word  
12 and -- and the '633 patent takes advantage of that, as was  
13 extensively discussed at the tutorial.

14 Throughout the -- the -- the -- and I think the issue here  
15 is -- is really what we're -- what are we talking about when  
16 we're talking about an address. And again, this is I  
17 believe --

18 **THE COURT:** Can I ask you whether an offset value is  
19 the same thing as an address from your perspective?

20 **MR. SETH:** No.

21 **THE COURT:** Yes or no?

22 **MR. SETH:** An offset value --

23 **THE COURT:** Mr. Seth. Mr. Seth, I need a "yes" or  
24 "no" answer to my question.

25 Is an offset value the same thing as an address, yes or no

1 from your perspective?

2 **MR. SETH:** An offset is also an address.

3 **THE COURT:** And --

4 **MR. SETH:** In the context --

5 **THE COURT:** Mr. Marton, is an offset value the same  
6 thing as an address from your perspective?

7 **MR. MARTON:** Yes. To the starting point address and  
8 the ending point address, the patent makes clear with Figure 2  
9 that those are offset values.

10 "Address" can mean different things in different contexts.  
11 It's the address -- you know, the address of a house is  
12 different than the address in a database. Display screen  
13 address is different than an address in a database. But  
14 for --

15 **THE COURT:** Clearly.

16 (Simultaneous colloquy.)

17 **THE COURT:** Go ahead. Finish your statement.

18 **MR. MARTON:** What's in Figure 2, which refers to the  
19 starting and end point addresses, which are recorded for each  
20 discrete piece that is put in the lookup table, the patent  
21 makes very clear with Figure 2 that those are offset values.

22 I don't think that the --

23 **THE COURT:** I also -- okay. That's fine. That's why  
24 I'm asking the question.

25 The second question is -- and just to confirm, right, the

1 term that -- there is no instance in this patent where the  
2 term can mean a different thing given the different --  
3 different parts of the patent.

4 So as a for instance, the address that is referenced in  
5 disputed term number one has to have the same meaning as the  
6 address that is referenced in disputed terms number two.

7 **MR. MARTON:** Your Honor, if I may address that, no  
8 pun intended.

9 Yes, I agree that as a general claim construction  
10 principal, terms must have the same meaning throughout a  
11 patent and particularly in a claim.

12 However, when we're looking at, say, claim 62 of the  
13 patent, the first instance of "address" is the beginning  
14 position of address in an electronic database, in a database.  
15 So it's an address in a database.

16 Now, the second instances of "address" are starting point  
17 address and ending point address of the cutup pieces of the  
18 source material. And those are described as by offsets from  
19 that beginning position address in the database.

20 Now, they're not inconsistent because they're both talking  
21 about locations in memory, whether virtual or physical. But  
22 what you're dealing with is a position in a database, and then  
23 an offset from that position in memory which is the  
24 beginning -- it's the starting point address for a cutup piece  
25 and then the ending point address for a cutup piece. Those

1 instances of addresses are byte offsets from an address in a  
2 database.

3 Then the fourth instance of "address" in the claims is the  
4 display address, and that's just -- the only thing that it's  
5 described in the patent for that are coordinates, screen  
6 coordinates, and that can be an address, too.

7 So I think "address" at a high level can mean, you  
8 know, the -- an -- a point of location, but what it means in a  
9 particular instance may be different. So a house address is a  
10 numbers in a street. Here, an address in a database is a  
11 memory location. And -- and starting point and ending point  
12 addresses are byte offsets from that location.

13 **THE COURT:** But then doesn't that defeat your claim  
14 that no construction is needed?

15 **MR. MARTON:** Oh. No, I -- I don't think so. No  
16 construction is needed for the first instance of "address"  
17 because I think the patent makes -- the claim makes very clear  
18 that the address -- and if I can share a screen, I can show  
19 the claim. It might be a little easier.

20 **THE COURT:** All right. Hold on.

21 **MR. MARTON:** All right.

22 **THE COURT:** Hold on a minute.

23 **MR. MARTON:** I -- okay.

24 When you're ready, I'll do it.

25 **THE COURT:** Okay. Go ahead.

(Demonstrative published.)

**MR. MARTON:** Let me flip down to this claim. So we're dealing with "beginning position address of textual source material stored in an electronic database." I think claim language itself is clear that that beginning position address is a beginning position address in an electronic database.

If -- if there is any ambiguity, I think we could say, okay, well, the address at which the source material starts -- the textual source material starts in an electronic database.

**THE COURT:** Well, and as I looked at the arguments, you know, Sentius is really focused on this use of character position as opposed to something where it starts.

And so, Mr. Seth, what I need you to focus on is why you think I should be importing that reference to a character position.

So if you can take that off the screen, Mr. Marton. Thank you.

**MR. MARTON:** Sure. Let me figure out how. Here we are.

**MR. SETH:** Your Honor, I -- I would say this. I don't believe that the proposed construction of Zoho is inaccurate. It is, however, I don't believe very helpful to a jury.

So throughout the patent, and -- and if I may share a

1 screen now.

2 **THE COURT:** Go ahead.

3 (Demonstrative published.)

4 **MR. SETH:** Sorry, Your Honor.

5 Throughout the patent -- and I'm at -- are you seeing  
6 Slide 3 of my deck, please?

7 **THE COURT:** I am.

8 **MR. SETH:** Okay. Very good.

9 Throughout the patent, the -- the positions, if you will,  
10 in the database are the position offsets from the beginning of  
11 the text.

12 And, you know, it's -- it's undisputed that all visual  
13 editors work off of characters by characters so that you can  
14 input characters, edit characters to form words, and otherwise  
15 do your word processing.

16 So throughout the patent, we're talking about having a  
17 beginning position which --

18 **THE COURT:** Let me ask you, what about a situation  
19 where the very first position is blank, there's nothing in it?

20 **MR. SETH:** Um-hmm. Yes, Your Honor. That's -- a  
21 blank is also a character within character schemes such ASCII.  
22 So even that blank has to have a character position to show  
23 that there's nothing at that particular character position.

24 **THE COURT:** So let me ask -- let me ask how this --  
25 how this would play out given what's described in the patent.

1       If you have an offset from a starting point in a -- as  
2       you're describing a word or however it's calculated, how does  
3       the lack of textual source material, which is in a first, in a  
4       blank, how does that play out?

5               **MR. SETH:** I'm sorry. Could you repeat the question,  
6       Your Honor?

7               **THE COURT:** I'm trying to understand -- so the  
8       beginning position of a textual source material, that doesn't  
9       include a blank, correct?

10              **MR. SETH:** No, it does actually, Your Honor, because  
11       the -- the textual -- characters for -- of text do include a  
12       character code for a blank space. And, in fact, that  
13       character code for a blank space is part of how parsers then  
14       identify where the beginning of a word is and where the end --  
15       the -- the first character of the word is and the -- the  
16       ending character.

17              So let's say, you're -- you're starting your text and for  
18       some reason, instead of putting in -- you want to type in  
19       "the" and instead of typing the "T" at the zero place, you --  
20       you hit the space bar. That space bar is recorded as a  
21       character. That zero position may be a space bar -- or a  
22       space. That zero position may be a -- a "T" for "the" or  
23       what -- or whatever you -- you started typing.

24              But you -- you either hit the space bar or you hit  
25       something else on your keyboard. But whatever that first

1 starting point is, that -- that is where your -- that's the  
2 reference -- that's the beginning position of the textual  
3 source material, and then you're starting to count characters  
4 from -- from those.

5 And those characters in the '633 patent were Kanji  
6 characters. Those are actually two-byte characters, for  
7 example. So each two bytes is a character. In ASCII, one  
8 byte is a character. But what you're doing is whatever your  
9 coding scheme is, you're going character by character so that  
10 every character has a corresponding display position because  
11 when you're the visual editor and you've opened the document,  
12 and it's got some text in it, you're going to parse through,  
13 you're going to see what all the positions of the text are,  
14 including the space bars, and then you're going to display all  
15 of that in the same order that each character is within the  
16 document.

17 **THE COURT:** All right. A response, Mr. Marton?

18 So Mr. Seth believes that your construction isn't wrong;  
19 it's just not helpful.

20 **MR. MARTON:** Well, I disagree with virtually -- well,  
21 most of the things Mr. Seth just said.

22 One, our construction is helpful -- well, no construction  
23 is needed, but if construction is needed, our construction is  
24 helpful.

25 I think where we're having a dispute here is whether the

1 location -- the information -- if I could bring up my screen,  
2 actually, it might be helpful.

3 **THE COURT:** All right. Go ahead.

4 **MR. MARTON:** Mr. Seth, if you could take your screen  
5 down.

6 **MR. SETH:** Oh, I'm so sorry.

7 **MR. MARTON:** Thank you.

8 (Demonstrative published.)

9 **MR. MARTON:** So I -- I -- I think our dispute -- I'm  
10 going to go up to just this --

11 (Demonstrative published.)

12 **MR. MARTON:** -- which is Figure 2. I think our  
13 dispute is what these numbers, for example, in Figure 2, 10  
14 and 15 mean. And what Mr. Seth is contending is that these  
15 are character offsets from the beginning of a document, so  
16 the -- within the file itself.

17 And what Zoho contends and I think what the patent and the  
18 file history makes abundantly clear is that these are not  
19 character offsets within the document. These are byte offsets  
20 which are distances in memory from a location in memory.

21 So this ten would be ten bytes into the memory from -- the  
22 memory in the database from the beginning position of where  
23 the source material and -- the source material is stored.

24 And this 15 would be 15 bytes into the memory from the  
25 beginning of the address in the database where the source

1 material is stored.

2 Now, what Mr. Seth is saying is that we don't care about  
3 memory location. We only care about character points within a  
4 document. And he's asserted that, you know, this patent, the  
5 '633 patent, is all about visual editors and that there's no  
6 dispute that visual editors work based off character offset so  
7 obviously that is what the '633 means.

8 Now, there is a dispute here. The dispute is the '633 is  
9 not about visual editors. It's not about modifying visual  
10 editors, and -- and we haven't gotten to the issue of whether  
11 all visual editors work on character offsets. I personally  
12 don't know. And it's not really relevant to this case because  
13 this patent's not about modifying visual editors.

14 And notably, the patent says nothing about character  
15 offsets and character positions. What it says is "offsets."  
16 And then if you look at the file history --

17 (Demonstrative published.)

18 **MR. MARTON:** -- it's really clear that what we're  
19 dealing with is byte offsets. And --

20 (Demonstrative published.)

21 **MR. MARTON:** -- during the --

22 **THE COURT:** So I -- if I could just interrupt for a  
23 second, and you can go back to your thought.

24 **MR. MARTON:** Okay.

25 **THE COURT:** So it would be your contention, then,

1 that in light of the prosecution history, an address is really  
2 expressed in terms of bytes, that the focus should be bytes  
3 not characters.

4 **MR. MARTON:** Yes, in terms of the -- the -- the  
5 starting point address of the discrete pieces and the ending  
6 point address. Those are in bytes. And then the beginning  
7 position address, which is the anchor point from those byte  
8 offsets, that is an address in a database. That is a memory  
9 address. Whether virtual or physical, it's a -- it's a memory  
10 address in a database.

11 So that -- that is what was made very clear to me in  
12 the -- in the file history.

13 The -- the patent is pretty -- there's not a lot said  
14 about this process in the patent. Everything about this  
15 process is contained in Figures 1 and 2 and columns 5 and 7,  
16 and it's -- it's pretty limited.

17 But the -- but the file history and -- and particularly  
18 the file history for the parent application is pretty clear.

19 In that prosecution history, we had a claim that is very  
20 much like the claim we're dealing with here, which had a  
21 "determining the beginning position of a source material  
22 image."

23 And notably, Sentius contends, well, this is very  
24 different because it says "source material image" rather than  
25 "textual source material." But in prior litigation, in

1 particular, the *Flyswat* litigation, Sentius actually  
2 characterized this source material image as the material that  
3 goes into the system to be cut up and then linked to external  
4 sources, so it's -- it is the same thing.

5 But in any case, in the '720 history, which is the parent  
6 application, we're dealing with a claim and -- particularly a  
7 claim limitation "determining the beginning position of a  
8 source material image," and this claim was rejected by the  
9 patent office in light of a patent that we'll refer to as the  
10 Cassorla, which is U.S. patent number 5,146,522.

11 And in that patent, there was an offset table, much like  
12 Figure 2, which linked locations -- words in an electronic  
13 document to external material or annotations. And the way  
14 that the location of those words was -- was characterized  
15 in -- in the lookup table -- and here on Slide 29, we're  
16 looking at Figure 3 from Cassorla. This is that lookup table.  
17 They had coordinates for words within the document. And  
18 that's the -- so these -- these are the coordinates. And  
19 these were relative positions within the document.

20 And the way this worked --

21 (Demonstrative published.)

22 **MR. MARTON:** So if we wanted to identify the location  
23 of a word "remarkable" in this example document here on  
24 Slide 30, you would first identify the chapter, which would be  
25 C1, and then the paragraph, which we're down in the third

1 paragraph, so --

2 **THE COURT:** Right.

3 **MR. MARTON:** -- P3.

4 **THE COURT:** You did that before.

5 **MR. MARTON:** Yeah. And then the sixth word in -- and  
6 there we have "remarkable," and that would be recorded as  
7 C1P3W6.

8 Now, in --

9 (Demonstrative published.)

10 **MR. MARTON:** -- response to that rejection on  
11 Slide 36, Sentius explained, well, Cassorla requires paragraph  
12 and word offsets in which links are determined by paragraph  
13 number and an offset with -- an offset within the paragraph.

14 In contrast, the claimed invention operates upon pure byte  
15 offsets. Now, what's significant about this is, you know,  
16 Sentius says, well, bytes and character are one and the same  
17 thing. Well, Mr. Seth just admitted that "byte" and  
18 "character" are not one and the same things.

19 A Kanji character is rarely one byte. It's sometimes two  
20 bytes. So a byte is not a character. A character is data.  
21 It's data within the file. And a byte is a unit of memory.  
22 And so what they're saying is our -- our invention operates by  
23 memory offsets, so byte offsets.

24 (Demonstrative published.)

25 **MR. MARTON:** Now, the examiner said, well, your

1 patent doesn't really reflect that in the claim language.  
2 They say, "you use broad terms such as 'position' and  
3 'location'" so Cassorla's coordinates and their offsets really  
4 still read on that.

5 (Demonstrative published.)

6 **MR. MARTON:** So what does Sentius do? On Slide 38,  
7 they amended the claim to look much like, say, Claim 62 now.  
8 So now, they say "determining the beginning position address  
9 of a source material in an electronic database." And they cut  
10 out the word "location" and they say "starting point address,"  
11 and they're saying "address" here to reflect that they're  
12 dealing with a memory address and byte offsets from that --  
13 from that memory address and that the -- the memory address is  
14 the address in the electronic database.

15 (Demonstrative published.)

16 **MR. MARTON:** When they made this amendment, Sentius  
17 explained to the patent -- patent office that, you know, we --  
18 we had this interview with the examiner, and the examiner said  
19 these amendments are sufficient to overcome the prior art.  
20 Now it reflects that we're dealing with pure byte offsets.  
21 And it says, "Cassorla uses the relative position within the  
22 document to fix the position of associated notations." So  
23 "relative position within the document" and then by  
24 contrast --

25 (Demonstrative published.)

1           **MR. MARTON:** Excuse me.

2           By contrast, the claims in Sentius's patent have been  
3           amended to reflect that address "on the electronic database is  
4           determined for the source material image," so what's critical  
5           here is we're dealing with -- we're dealing with an address in  
6           memory, an address in a database. And that's what our -- our  
7           proposed construction reflects.

8           **THE COURT:** All right.

9           Mr. Seth, response?

10          **MR. SETH:** Yes, Your Honor. Several responses.

11          First, let me start by emphasizing that the '720 patent  
12          was relinquished and all of its claims were relinquished when  
13          Judge Armstrong said that they were indefinite. The claims  
14          were rewritten and issued as the '633 patent claims, the ones  
15          that are at issue.

16          Why is that important? Because Mr. Ryan is trying to use  
17          the prosecution history from a completely different patent,  
18          completely different claims, with completely different claim  
19          terms.

20          If I may share my screen, I want to put up the actual  
21          claim term that was at issue in the '720 patent because this  
22          is very important.

23          Are you seeing Slide 92, Your Honor?

24          **THE COURT:** I am.

25                               (Demonstrative published.)

1           **MR. SETH:** Okay. Thank you.

2           **THE COURT:** And as part of this, can you explain to  
3 me why you added the word "address" as opposed to just "pure  
4 byte offsets"?

5           Go ahead.

6           **MR. SETH:** Yes, I -- I will -- I will get to every  
7 point, Your Honor, but I just want to mention, because I think  
8 it is important, that in the claim of the '720 patent, and  
9 part of the -- the -- the problem that Judge Armstrong had was  
10 that it was a source material image stored in electronic  
11 database. And everything that was in this claim, like in 8.2,  
12 "cutting the source material image," and in 8.1, "determining  
13 the beginning position address of the source material image in  
14 the electronic database," and then in 8.7, "converting the  
15 address" -- I'm sorry -- yeah, "converting the address of the  
16 discrete portion to an offset value from the beginning  
17 position address of the source material image."

18           So "image," "image," "image," "image." This is one of the  
19 substantive changes that was made in the '720 patent, and it  
20 makes a difference because what we're talking about in the  
21 '633 patent is the actual source material. So what we're  
22 talking about is the text in the document once you open the  
23 document up and start editing on the document.

24           The "source material image" is what is shown on -- in  
25 contrast is what's shown on the screen that the user is

1 allowed to interact with.

2 Now, with regard to the -- the prosecution history  
3 itself --

4 (Demonstrative published.)

5 **MR. SETH:** -- I think it's important -- let me  
6 just --

7 (Pause in the proceedings.)

8 **MR. SETH:** Sorry, Your Honor. Just one second while  
9 I locate the slide I'm -- we're a little out of order here.

10 **THE COURT:** Well, I gave you a heads-up on that  
11 before.

12 **MR. SETH:** No criticism, Your Honor.

13 **THE COURT:** I don't think I have the reexamination  
14 filings, do I?

15 And is there some reason why they weren't given to me in  
16 terms of whether or not there was a disclaimer or not?

17 **MR. SETH:** Well, because, Your Honor, there -- the --  
18 the -- Zoho has taken the disclaimer position they have not  
19 made any disclaimer argument with regard to the actual '633  
20 prosecution history. This is specifically coming right out of  
21 the '720 prosecution history, as I said.

22 And -- and so that's I believe why you -- you don't have  
23 that. They're not making any argument from the '633  
24 prosecution history.

25 But I --

1                   **THE COURT:** No, I meant the 7 -- well, all right.

2                   Mr. Marton?

3                   **MR. MARTON:** Sure. Mr. Seth, could you actually  
4 bring up your Slide 92?

5                   **MR. SETH:** Yeah.

6                                   (Demonstrative published.)

7                   **MR. MARTON:** Thank you.

8                   I have a couple quick points to make. So the -- the file  
9 history from the '720 -- that's a parent application to the  
10 '633. That is part of the prosecution history for the '633.  
11 That is as much a part of the file history for the '633 as  
12 anything. It's part of the intrinsic record, and it is  
13 important and relevant to understanding the '633.

14                  Now, in terms of Mr. Seth's argument that the Claim 8 at  
15 issue here in the '720 parent application, that being  
16 meaningfully different than the '633 claims, that's just  
17 fundamentally not correct.

18                  These claims map almost exactly to the claims in the '633  
19 patent. There is this -- this difference that Mr. Seth  
20 pointed out that the "determining the beginning position  
21 address of a source material image" is different than the  
22 "textual source material" that is in the '633 claims.

23                  Now, why is there that difference? Well, it's because in  
24 the *Flyswat* litigation, the reason that the '720 patent was  
25 invalidated is because if you look at Claim 8.1, it says

1 "determining the beginning position address of a source  
2 material image stored in an electronic database, the source  
3 material image including a plurality of discrete pieces."

4 Now, if you jump to 8.2, "cutting said source material  
5 image into said discrete pieces."

6 So the court determined that this was an ordered series of  
7 steps, but that the cutting was happening after the source  
8 material image was already cut up. And that was a logical --  
9 (distorted and unintelligible) -- and -- (distorted and  
10 unintelligible) --

11 **THE COURT:** Mr. Marton?

12 **MR. MARTON:** Yes.

13 **THE COURT:** You're -- you've broken up, so I need you  
14 to just repeat that last sentence, please.

15 **MR. MARTON:** Okay. So in the *Flyswat* litigation,  
16 the --

17 **THE COURT:** You were talking about cutting.

18 **MR. MARTON:** Oh, I was talking about cutting. Okay.

19 So the "determining beginning position address of source  
20 material image stored in electronic base [sic], including a  
21 plurality of discrete pieces," so this -- this source material  
22 image that's in the electronic database has discrete pieces  
23 already.

24 And then in 8.2, it says, "cutting said source material  
25 image into said discrete pieces." The court in the *Flyswat*

1 litigation determined -- and -- and, frankly, Sentius has  
2 agreed in all its litigations that this is an ordered sequence  
3 of steps so they happen in order, determining first, cutting  
4 next, determining next.

5 And what the *Flyswat* court determined was, well, if the  
6 source material image already has discrete pieces, why then is  
7 it cutting said source material image into said discrete  
8 pieces later? And it said this is illogical, doesn't make  
9 sense, and fails to comply with 101 utility requirement; also  
10 fails to comply with certain requirements under 112.

11 Now, in the reissue, what Sentius did was they changed  
12 "source material image" just to be "textual source material"  
13 so that it's different than the image later. So the textual  
14 source material is what's fed into the system. It's what  
15 comes from the publisher. It's fed into the system. It's  
16 then cut into pieces, and then it's reassembled to create the  
17 image.

18 So basically the '633 is the same as the '720 claims.  
19 It's just -- fixes the problem with certain language that was  
20 pointed out by the *Flyswat* court.

21 **THE COURT:** Okay. Back to my -- back to my question,  
22 which is, is the reexamination filings relevant? And if they  
23 are, shouldn't I have them?

24 **MR. MARTON:** So if you're referring to the  
25 reexamination filings, the filings from the reissue, there was

1 not anything particularly relevant there.

2 I thought that the -- the most important statements and  
3 the ones that gave most clarity as to what the actual  
4 invention meant were from the parent prosecution history, that  
5 is, the '720 patent prosecution history and then also from the  
6 *Flyswat* litigation.

7 **THE COURT:** Okay.

8 Let me go back to Mr. Seth.

9 Go ahead.

10 **MR. SETH:** Thank you, Your Honor. I guess I have the  
11 screen.

12 So I think it's important that we go back to basic claim  
13 construction principles. Mr. Ryan [sic] acknowledged that  
14 these claims are different from the claims that are actually  
15 at issue and that -- with regard to the claim terms that are  
16 actually at issue, one of which is not "source material image  
17 stored in electronic database," nor is "cutting source  
18 material image," none of those are at issue. These are not  
19 terms in the '633 claims.

20 And -- and so I think we need to go back to the -- the  
21 fundamental argument that -- that Zoho is making with regard  
22 to Cassorla. Now, there's -- has to be a clear disavowal of  
23 claim scope. That's claim construction law 101. It's their  
24 burden to show a clear disavowal of claim scope. And what  
25 they're trying to do is take the -- the use -- the undisputed

1 use of the term "byte offset" in the '720 prosecution history  
2 and say that this is -- this is a clear -- this is a clear  
3 reference to a memory location.

4 And in order to do so, first, they make a technical error.  
5 They say that a byte is only a store -- a unit of memory,  
6 which is it's not. It's a unit of data. And -- and we know  
7 this because characters are encoded in bytes of data.

8 So if you -- you have a coding scheme that's a one-byte  
9 coding scheme per character, then you're going to have eight  
10 bits of data that encode a character.

11 If you got a 2-byte scheme, you'll have 16 bits. If you  
12 got a 3-byte scheme, you'll have 24 bits. But these are not  
13 just simply memory locations. These are units of data set.  
14 So I wanted to correct that.

15 Now, I want to go to Cassorla, and I believe I've located  
16 the slide I wanted to show you earlier.

17 (Demonstrative published.)

18 **MR. SETH:** So in Cassorla -- and let me go to my  
19 Slide 14, and then I'll go to Slide 13. In Cassorla --

20 **MR. MARTON:** Excuse me. I need to interject.  
21 Actually, this is from Zoho's technical tutorial, not supposed  
22 to be used in claim construction.

23 **THE COURT:** I --

24 **MR. SETH:** I believe that there were several slides  
25 that Mr. Ryan just used from his tutorial including the slide

1 he showed us on Slide 29. I'm just rebutting that.

2 **THE COURT:** I saw something similar --

3 **MR. MARTON:** Okay.

4 **THE COURT:** -- from you, Mr. Marton.

5 **MR. MARTON:** This was not a slide that I -- I used  
6 something similar. This is a slide from our technical  
7 tutorial. My understanding is it wasn't supposed to be used,  
8 but that's fine.

9 Go -- go ahead.

10 **MR. SETH:** Well, Mr. -- Mr. Ryan's [sic] Slide 29, I  
11 believe it was, showed us the way the Cassorla was showing --  
12 using various points in the -- or tags in the document, I  
13 should say, for headers and -- and chapters and paragraphs and  
14 words. And the applicant was certainly distinguishing his  
15 patent from Cassorla. That's undisputed, but by -- by saying  
16 that we're using pure byte offsets.

17 And as Dr. Weissman was explaining and -- in showing  
18 this -- this example of "down the rabbit hole" is that each  
19 one of those boxes is a character position. And in the '633  
20 patent, it -- you're counting those character positions all  
21 the way down to "remarkable."

22 So they -- if -- and I don't know. I haven't counted  
23 these boxes, your Honor. But let's just say "remarkable"  
24 started at box 101, okay, or character position 101. And the  
25 character position is an offset, that -- where the "C" is in

Chapter 1, that's zero. That -- and in that case, it's not a blank character. It's a -- it's the character "C." That's the first position. And you're counting all the characters down to "remarkable." So if "C" is the zero character position, the first character position may be assigned a 0 logical address. And the --

**THE COURT:** I'm going to stop you 'cause we went through this on the tutorial. The question is --

**MR. SETH:** Yeah.

**THE COURT:** -- not that basic premise.

**MR. SETH:** Okay.

**THE COURT:** The question is what does the patent say. And the argument needs to focus on why I should use the word "character" in a construction given the patent and -- and the intrinsic record.

**MR. SETH:** Sure.

(Demonstrative published.)

**MR. SETH:** Through -- through -- throughout the patent -- and -- and let me -- actually, let me just put up one slide.

(Demonstrative published.)

**MR. SETH:** This is from -- this is not from the tutorial but this is from the supplemental Weissman declaration this was docket 63-2, Exhibit 1 to the supplemental Weissman declaration. And characters form the

1 basis of all text data processing. This is undisputed.

2 The -- the issue here is whether there was a clear  
3 disclaimer when the applicant used "byte offset" given that  
4 the only -- the specification showed that all the offsets are  
5 positional offsets from the beginning of text.

6 This is from the '633 patent at column 7, lines 30 through  
7 49 at -- repeatedly the position offsets are from the  
8 beginning of the text.

9 And the reason that we're doing that is because when we --  
10 when the user wants to click on a word that has some  
11 additional information linked to it, in the '633 patent, they  
12 get to click anywhere on that word, on any character in that  
13 word, they can right click it and get to whatever it --  
14 information it's linked to that word is linked to.

15 And so the patent is explaining that when the user clicks  
16 within the text image, the -- the text on the screen, the  
17 location of the pointer is determined and converted to a  
18 position offset from the beginning of the text, so -- and that  
19 is why, Your Honor, we're -- we're saying that.

20 It's in the claims itself based on the -- the beginning  
21 position address, determining the beginning position address.  
22 And the reason that we're doing that is because we're going to  
23 be determining starting point addresses and ending point  
24 addresses of each of plurality of the discrete pieces. The  
25 plurality of the discrete pieces are the words in -- the --

1 the character strings I -- I loosely defined --

2 **THE COURT:** Well, that's --

3 **MR. SETH:** -- defined as "words" in the electronic  
4 database. And they're -- and those are going to be measured  
5 as an offset from the beginning position address.

6 **THE COURT:** Well, let's -- that's a good segue.

7 Let's -- let's go the "starting point address" and "ending  
8 point address."

9 **MR. MARTON:** Could I make one rebuttal argument to  
10 Slide 9?

11 **THE COURT:** Quickly.

12 **MR. MARTON:** Sure.

13 Mr. Seth, could you bring up Slide 9 in full?

14 So Mr. Seth points to --

15 (Demonstrative published.)

16 **MR. MARTON:** -- this language in column 7 regularly,  
17 this language at line 33, "When an image is created, the cuts  
18 are indexed based upon position offset from the beginning of  
19 the text."

20 **THE COURT:** Okay. Mr. Marton, I still have a --

21 **MR. MARTON:** Yes.

22 **THE COURT:** -- court reporter.

23 **MR. MARTON:** Okay.

24 **THE COURT:** And the same rules apply. When people  
25 start -- lawyers start reading, they read very fast. And just

1 because we're on video and not in the courtroom doesn't mean  
2 that that rule changes.

3 **MR. MARTON:** Yes, Your Honor.

4 Okay. So this language at line 33 of column 7 of the '633  
5 patent that says, "when an image is created, the cuts are  
6 indexed based upon the position offset from the beginning of  
7 the text," this is the planning that Mr. Seth and Sentius rely  
8 on heavily to support the notion that there is a character  
9 offset.

10 There's no reference to it, a "character position offset"  
11 here or anywhere else in the specification. This admittedly  
12 is not very clear. This language is not very clear what is  
13 meant by the "position offset from the beginning of the text."

14 Now, we look to the file history, as I've gone over  
15 multiple times -- to -- to get more clarity where there are  
16 very, very clear statements about what that offset means. And  
17 it is a byte offset.

18 And Sentius contends, well, those byte offsets are the  
19 same as character offsets, but the patentee did not say  
20 "character offsets," and a byte is not the same as a  
21 character. A byte is a unit of measure in memory. It is --

22 **THE COURT:** I --

23 **MR. MARTON:** -- eight bits. It's like a liter, and  
24 you could fill a liter with milk or you could fill it with  
25 water.

1 Now, a byte could be filled with a character or it could  
2 be filled with other data, so they're two very different  
3 things. And what Sentius is trying to do is morph this into a  
4 measurement of data rather than a measurement of memory.

5 But the patent file history couldn't be more clear, that  
6 this is all about a beginning position address in a database  
7 and then byte offsets, which are measurements of memory, from  
8 that beginning position address.

9 And that's all I have to say. Thank you.

10 **THE COURT:** All right. Let's go ahead and move on to  
11 "starting point address" and "ending point address." As I  
12 said, I thought it was a good segue because, again, Sentius  
13 here is focused on character position, and Zoho is focused on  
14 this kind of offset value -- this -- you know, it seems to me  
15 that the debate that we were just -- I was just hearing from  
16 you -- or, actually, which also segues to the next term,  
17 "offset value," all of these are all related. And so I think  
18 in many ways, it's going to be -- arguments are probably the  
19 same. But I'll let you -- I'll let you go ahead and have the  
20 argument.

21 One of the things that you should know is that I do look  
22 at consistency in all disputed terms across the patent,  
23 especially when I have to instruct the jury on these topics --  
24 so to the extent that that's helpful when you're thinking  
25 about your argument. All right.

1 Is there anything different? I'll ask you, Mr. Seth, is  
2 there anything different here really with respect to the  
3 arguments that the address -- the starting point address is --  
4 is that character position from what you've been arguing?

5 **MR. SETH:** No, Your Honor. I don't think that there  
6 is. I think Your Honor's a hundred percent correct. These  
7 are all related terms. You have some reference position, and  
8 you're going to be measuring the -- the offset from that  
9 reference position.

10 We do propose that these are the starting and -- or the  
11 starting and ending character positions of a word. I think  
12 that is a hundred percent consistent with the field of this  
13 invention, the disclosure of the patent, the use of "position  
14 offsets" throughout the patent.

15 And I think problem with Zoho's construction here is that  
16 they're using -- they're trying to propose that the starting  
17 address and ending address be defined by "offset value." And  
18 what they're -- and -- and I don't know that that's -- I think  
19 defining one claim term by another claim term is not  
20 necessarily helpful to a jury, which I think is the purpose of  
21 this process. And I think that --

22 **THE COURT:** Well, I mean -- I'm going --

23 (Simultaneous colloquy.)

24 **THE COURT:** I'm going to interrupt you.

25 I mean, what they argue the offset value is -- and all of

1 these things build, right, are the distance in bytes from the  
2 beginning point. I mean, again, remember, a patent's supposed  
3 to teach something, right? And if you are teaching how to  
4 make this -- the technology work in an electronic context,  
5 there is some merit to what it is they're arguing; that is,  
6 that there's some value or there's some distance, right? You  
7 used the word "value". They use the word "distance." It's  
8 what I'll figure out here.

9 But it's not necessarily a bad thing to say, this is how  
10 one's term is defined and then to use that term in a layered  
11 approach, right, to understand how the patent is working. You  
12 do the same thing.

13 So -- I mean, both of you define "offset value." You  
14 know, query whether that even needs to be defined, but maybe  
15 it does.

16 **MR. SETH:** That's not a -- a bad point, Your Honor.  
17 I mean, I think we're -- we're in agreement that it's a  
18 distance from whatever the beginning position address is, the  
19 offset value is a value that measures the distance or the  
20 distance between the two -- or the difference between two --  
21 two addresses.

22 The -- the -- the fundamental problem that -- and maybe  
23 this -- you know, maybe this is a draw, but the -- they're --  
24 the -- they're saying that it's a -- clearly a memory address.  
25 And they're saying that it's clearly a memory address because

1 they're making the proposition that a byte is just a unit of  
2 storage, which is not a correct statement of fact.

3 And secondly, the -- it's a unit of data as well as a unit  
4 of store -- storage.

5 And there's no dispute that these are electronic  
6 addresses, but the question is the -- the claim doesn't use  
7 the word "byte offset." The patentee used the word "byte  
8 offset" in the prosecution history. They're saying this is  
9 clearly a memory address and that that is our fundamental  
10 proposition or fundamental dispute.

11 Now, we believe, Your Honor, that -- that anybody of  
12 ordinary skill in the art would know that the position from  
13 the beginning of the text, which is throughout the  
14 specification, is the character position, because whether it's  
15 one byte or many bytes, each byte encodes a character.

16 You know, whether it's two bytes or a one-byte scheme or  
17 three-byte scheme, the bytes encode characters. And all word  
18 processing is based on characters. And the point that -- that  
19 Sentius was making in connection with Cassorla is that you can  
20 just count the bytes that encode the characters and -- and you  
21 don't have to use some reference scheme in Cassorla.

22 And this allowed the -- the -- the '633 patent to be used  
23 with the existing functionality of visual editors.

24 So I -- I don't think that there's anything else --  
25 you're -- you're correct, Your Honor. Other than this

1 fundamental dispute, there's not really a separate dispute  
2 about starting and ending point addresses.

3 **THE COURT:** You define "offset value" as a value from  
4 a beginning point. Would you also define it as a -- somehow a  
5 character position?

6 **MR. SETH:** Yes, Your Honor. We --

7 So first of all -- and I don't -- am I not -- I don't  
8 think I'm still sharing the screen. Let me just -- if I may.

9 **MR. SETH:** Are you seeing my Slide 23, Your Honor?

10 **THE COURT:** I am not, but I can --

11 **MR. SETH:** Oh, I'm sorry.

12 (Demonstrative published.)

13 **MR. SETH:** Believe now you are.

14 **THE COURT:** Yes.

15 **MR. SETH:** Okay.

16 So, Your Honor, we've already accepted a value or  
17 distance. This was a previously construed term in the  
18 *Blackberry* case, and it was defined as a value from the  
19 beginning point.

20 Zoho had a problem with the value. They didn't think that  
21 was helpful enough, so they had distance. We're okay with  
22 distance from the value or distance from a beginning point.  
23 And I don't know if that answered your question.

24 **THE COURT:** Okay. That's helpful. Thank you.

25 All right. Then Mr. Marton? Claim --

1           **MR. MARTON:** Yes.

2           **THE COURT:** -- Claims 2 and 3, again, I think that  
3 all of these kind of overlap together.

4           Is there more that you want to say on this? And what  
5 about this notion of whether we even need to define "offset  
6 value"? Is there a plain and ordinary meaning, especially in  
7 light of your own constructions?

8           **MR. MARTON:** Sure. So --

9                               (Demonstrative published.)

10          **MR. MARTON:** -- to "starting point address" and  
11 "ending point address," I agree that the arguments here are  
12 directly tied to the arguments about "beginning position  
13 address."

14          The one issue I would like to just restate, and I think --  
15 I think I've said it before, but I have recognized --

16          **THE COURT:** I'll just remind you, if you've said it  
17 before, you may not want to waste time saying it again. Your  
18 time is limited.

19          **MR. MARTON:** Okay. It's addressing a comment that  
20 you made directly before these terms. And it was about  
21 consistency across use of terms within the claims.

22          And I -- I recognize that describing the -- the first  
23 instance of "address" as "an address in a database" and then  
24 the second and third instances of "address" as an "offset  
25 value" is a bit odd. The reason we have to do this, it's

1 because it's what the patent tells us. If we look at  
2 Figure 2 --

3 (Demonstrative published.)

4 **MR. MARTON:** -- and the associated language to  
5 Figure 2, it says that the beginning position address and the  
6 ending position address, though it doesn't use the term  
7 "address." "Address" is not actually in the specification,  
8 but what it says is that these beginning position and ending  
9 position of the cut words are offset values.

10 And so we're getting that "offset value" language directly  
11 from the spec. It's the only discussion of what is in  
12 Figure 2. It is the only explanation of what the "starting  
13 point address" and "ending point address" is.

14 Now, in terms of the definition of "offset value," I do  
15 think that we need --

16 (Demonstrative published.)

17 **MR. MARTON:** -- a -- a construction here. And the  
18 reason is the file history. In the file history, as we've  
19 said multiple times, Sentius made very clear that they're  
20 dealing with byte offsets, pure byte offsets. Over and over  
21 they said in prosecution, the claimed invention operates on  
22 pure byte offsets. And --

23 (Demonstrative published.)

24 **MR. MARTON:** -- these offsets are off of the address  
25 on the electronic database.

1 To make the -- the claims adhere to what was said in the  
2 prosecution history, we have to construe -- we have to  
3 construe "offset value" --

4 (Demonstrative published) --

5 **MR. MARTON:** -- to be a distance in bytes from the  
6 beginning point.

7 Now, there's been this discussion by Sentius that there  
8 wasn't a -- a clear disclaimer. We disagree with that. There  
9 was a very clear disclaimer. But even second to that, absent  
10 a clear disclaimer, the prosecution history is always relevant  
11 to construction. And there does not need to be a clear  
12 disclaimer for -- to inform one skilled in the art what the  
13 invention is about.

14 And I -- I believe that statements made in the context of  
15 distinguishing Cassorla were unequivocal and very clear that  
16 what we're dealing with when we're talking about Sentius's  
17 invention is pure byte offsets.

18 So that's why I think we need a construction of that term.  
19 Otherwise, I actually agree that there is, you know, a general  
20 meaning for an offset value. It's just clearly changed by --  
21 by Sentius. And -- and one --

22 **THE COURT:** I -- I -- go ahead.

23 **MR. MARTON:** One final point. Mr. Seth mentioned  
24 that their construction comes from the *Blackberry* litigation.  
25 Well, that was an agreed construction at the point of

1 settlement. There was a claim construction hearing, no ruling  
2 from the court. And then before -- before a ruling came from  
3 the court, the parties settled and issued a stipulated set of  
4 constructions.

5 **THE COURT:** I see.

6 **MR. MARTON:** So I put no value on that.

7 **THE COURT:** So a couple questions. If I used Zoho's  
8 construction and told the jury that a starting point address  
9 was an offset value from the beginning position address to the  
10 starting point --

11 **MR. MARTON:** Um-hmm.

12 **THE COURT:** -- and then told them that the offset  
13 value meant a distance in bytes from a beginning point --

14 **MR. MARTON:** Um-hmm.

15 **THE COURT:** -- I think they would be entirely  
16 confused.

17 **MR. MARTON:** I think it would be confusing absent  
18 more explanation, but I -- I think we could make it quite  
19 clear with a simple graphic.

20 **THE COURT:** But you're --

21 (Simultaneous colloquy.)

22 **THE COURT:** But you're saying that the value is from  
23 a -- in one, you say that the value is -- it's an offset value  
24 from a beginning position address, and then -- but it's all --  
25 I would have to say "a starting point address is the distance

1 in bytes from a beginning point --"

2 **MR. MARTON:** Um-hmm.

3 **THE COURT:** "-- from the beginning position address  
4 to the starting point"?

5 **MR. MARTON:** Um.

6 **THE COURT:** So you see what I'm saying?

7 **MR. MARTON:** I do. I do.

8 **THE COURT:** If I took out -- if I took out -- if I  
9 used your construction and substituted --

10 **MR. MARTON:** Um-hmm.

11 **THE COURT:** -- what you are describing as the  
12 definition of "offset value" and put your definition in there,  
13 it doesn't really make sense.

14 **MR. MARTON:** Okay. I -- I actually -- I see the  
15 issue. And I appreciate you calling it out. One -- one  
16 solution is to modify Zoho's construction for "starting point  
17 address" and "ending point address" and say --

18 (Demonstrative published.)

19 **MR. MARTON:** -- "a distance in bytes from the  
20 beginning position address to the starting point."

21 **THE COURT:** Okay.

22 **MR. MARTON:** And that -- that would solve it. And  
23 then we have --

24 **THE COURT:** Hold on. Let me -- I'm just going to --  
25 I'm going to make a note.

1           **MR. MARTON:** Okay.

2           **THE COURT:** "The distance in bytes" -- all right. Go  
3 ahead.

4           **MR. MARTON:** "From the beginning position address to  
5 the starting point."

6           **THE COURT:** Okay.

7           **MR. MARTON:** And then we do the same, you know, for  
8 the ending character, but -- for the "ending" --

9           **THE COURT:** Right.

10          **MR. MARTON:** -- "point address." And that would  
11 solve it. That's a good point. And I'm -- now that you've  
12 pointed out, I regret not harmonizing that way. I was  
13 actually -- thought I was making it more simple but clearly  
14 was not.

15          **THE COURT:** In the -- let's see -- January and May  
16 1996 in the remarks, this is to Sentius, the remarks add the  
17 word "address" but not "pure byte offset." Should I take  
18 any -- should I take anything away from that particular remark  
19 to both of you?

20          **MR. SETH:** Yes, Your Honor. You -- you should,  
21 because, as you correctly point out, the claim does not say a  
22 "pure byte offset." The words of the claim are an "offset  
23 value."

24          And -- and let me just correct the record, Your Honor.  
25 Judge -- Judge Payne in the *Blackberry* case did construe

1 "offset value." And let me give you the quote. It was in the  
2 preliminary construction, and it was "a value from a beginning  
3 point." Okay?

4 (Demonstrative published.)

5 **MR. SETH:** That was an actual construction issued by  
6 Judge Payne in his preliminary constructions.

7 But going back to it, you're -- you're a -- you're a  
8 hundred percent correct that -- that the claim doesn't use --  
9 it use -- uses the term "offset value." And the problem is  
10 that they want to replace that with "byte offset." And  
11 they're saying that there's -- and -- and what's worse is that  
12 they're saying that "byte offset" is some kind of memory  
13 location, when, in fact, a "byte offset" is a -- a unit of  
14 data, and as we're -- and as we're saying, it's a -- it's a  
15 character position.

16 So if I may, I'd just like -- I have two slides I just  
17 want to use to --

18 **THE COURT:** But, you know, it's interesting, right?  
19 And, again, this brings back to the beginning. The --  
20 "character" isn't a term that -- well, you both want to -- you  
21 both want me to use something else. Right? That is, you want  
22 it defined as a "character." They want it defined as a "byte  
23 offset." We've gone through this, right?

24 **MR. MARTON:** Yes, Your Honor.

25 **MR. SETH:** Yes, Your Honor. But I do want to

1 emphasis that they are further -- and the problem that they're  
2 having and if -- if I may, just one slide, Your Honor.

3 **THE COURT:** That's okay. Your time's limited, so --

4 **MR. SETH:** Well, this is the statement on Slide 28,  
5 "pure byte offsets." And the problem is, is that -- and -- is  
6 that they may -- they may be at trial tempted to say that  
7 these are limited to memory locations or physical storage  
8 locations, but this -- the --

9 **THE COURT:** And, look, I've got -- I've got another  
10 case with you against Apple so I don't really care what  
11 they're going to say at trial. The question is what is the  
12 patent teaching. That's the issue.

13 **MR. SETH:** Right. And the patent is teaching that  
14 it's a position offset. And the -- and the patentee, with  
15 regard to another claim that is not at issue here, argued that  
16 Cassorla had a different teaching, which it does. But the  
17 difference in the teaching is as we are describing.

18 So it -- it doesn't -- their proposed construction is  
19 defining "offset value" as a "byte offset." And -- or  
20 distance in bytes from the beginning point. You said, how is  
21 the jury going to understand what that means --

22 **THE COURT:** Let me --

23 **MR. SETH:** -- and --

24 **THE COURT:** Finish off.

25 **MR. SETH:** This is -- this is the issue, because

1 then -- then they're trying to say that this is a memory  
2 location, and --

3 **THE COURT:** Who is the person of ordinary skill in  
4 the art for these patents?

5 **MR. SETH:** I'm sorry?

6 **THE COURT:** Who is the person of ordinary skill in  
7 the art for these patents?

8 **MR. SETH:** Somebody who works with designing word  
9 processing applications.

10 **THE COURT:** And what would that be? What would the  
11 art be?

12 **MR. SETH:** Word processing -- visual editors and word  
13 processing applications, is the art.

14 **THE COURT:** So no computer science degree.

15 **MR. SETH:** Computer science degree would be helpful.

16 **THE COURT:** Do you not have a definition?  
17 How about you, Mr. Marton? Who's a person of ordinary  
18 skill in the art?

19 **MR. SETH:** I believe he's muted.

20 **MR. MARTON:** My apologies. I thought I was unmuted.  
21 Yes, I'm pulling it up. We -- we have a definition in --  
22 here we are.

23 **THE COURT:** And remind me of the year.

24 **MR. MARTON:** So in -- for the '633, it's '94. So  
25 looking at document -- or Docket 53, page 5 and page 6, which

1 are the declaration from Zoho's expert John Weissman, he has  
2 opined that a person of ordinary skill in the art would have  
3 at least a Bachelor's degree in computer science or a related  
4 field or the equivalent work experience in computing operating  
5 systems, programs and databases, with some experience with  
6 graphical user interfaces.

7 **THE COURT:** Do you agree, Mr. Seth?

8 **MR. SETH:** Yes, Your Honor.

9 **THE COURT:** Okay.

10 **MR. SETH:** May I give our description of a person of  
11 ordinary skill?

12 **THE COURT:** Yes.

13 **MR. YORIO:** It's in paragraph 58, Dr. Madisetti's  
14 declaration.

15 **THE COURT:** Could I have a docket number?

16 **MR. YORIO:** Document 51 at page 20.

17 **THE COURT:** Okay.

18 **MR. YORIO:** And he says, "a person of ordinary skill  
19 in the art in this time frame," which is 1994, "would have  
20 been someone with at least a Bachelor's degree in computer  
21 science, electrical engineering, or related discipline and two  
22 to four years of experience."

23 **THE COURT:** Okay.

24 **MR. YORIO:** "Alternatively, a person of ordinary  
25 skill in the art may have been someone with an advanced degree

1 in computer science, electrical engineering or related  
2 discipline." It's paragraph 58.

3 **THE COURT:** All right. Thank you.

4 I mean, it just occurred to me, right, that that's  
5 obviously an important topic because this is teaching  
6 something, again. It's not theoretical in that sense. It's  
7 trying to teach something to individuals. And it's 1994.  
8 Right?

9 Today, there are programs that allow -- I mean, when my  
10 kids were young, I sent my kids to camp, and they learned how  
11 to design web pages, right. So back in the day, kids couldn't  
12 design web pages. Today, they design them better than adults.

13 So, you know, the -- it matters what is -- who we're  
14 trying to communicate with. Right.

15 But I think we need to just move on here. So let's move  
16 to four, "image of source material and source material image."

17 It looks like, you know, what I'm seeing here is Sentius  
18 believes that it is the -- I mean, the first part of both your  
19 constructions are the same, that is, "an image displayed on a  
20 computer screen derived from," and then that's where you  
21 change. So Sentius wants it to be "derived from the source  
22 file," and Zoho wants it to be "derived from the text created  
23 by reassembly of the cut pieces of" -- either source  
24 material -- I'm assuming "textual source material," right?

25 **MR. MARTON:** That -- that is correct, "textual source

1 material."

2 **THE COURT:** "Of textual source material." Okay.

3 Why don't we start with Zoho on this one.

4 **MR. MARTON:** Okay.

5 I will share my screen.

6 (Demonstrative published.)

7 **MR. MARTON:** Okay. So Zoho's construction comes  
8 directly from the specification here at -- I'm looking at  
9 Slide 56, column 7, lines 22 through 29. It describes the  
10 compilation step. And it says, "during text" -- "during  
11 compilation, the cut text is reassembled to create an image of  
12 the text that the end-user sees."

13 This is the only discussion with of an image of the text.  
14 And so Zoho's construction comes from that.

15 (Demonstrative published.)

16 **MR. MARTON:** This is consistent with what the *Flyswat*  
17 court interpreted the "source material image" to mean, not for  
18 the -- so one of the issues in the *Flyswat* court was "source  
19 material of images" we showed before was used in multiple  
20 places. And they actually gave different constructions to it  
21 in different places because they couldn't make them work  
22 together.

23 So in the first instance, the source material image was  
24 treated as the -- the data as input to the system. But then  
25 for the later instances of it, the -- the court construed

1 "source material image" to mean "an image displayed on a  
2 computer screen derived from the text created by means of  
3 linking and reassembly of the cut species from the souther  
4 material."

5 Now, I thought that was an overly complicated construction  
6 so took out the "linking" part and just proposed a  
7 construction that really followed what was said in column 7,  
8 which is that the image is something that's created from  
9 reassembly of the cut pieces.

10 So that's pretty much it. I think it's pretty  
11 straightforward. I think one skilled in the art would review  
12 the patent and pretty quickly understand that the images is  
13 the reassembled cut pieces.

14 The problem with Sentius's construction is it's general.  
15 It just says an image of the text that's derived from the  
16 source material in any way, but -- but the patent makes clear  
17 the only instance of an image that's described is that which  
18 is created from the reassembly of the cut pieces.

19 **THE COURT:** All right.

20 Mr. Seth, are you doing this one?

21 **MR. SETH:** Yes, Your Honor.

22 Let me just take the screen if I may.

23 (Demonstrative published.)

24 **MR. SETH:** So, Your Honor, as Mr. -- Mr. Marton  
25 points out, they have in their claim construction that this

1 image is created by the reassembly of the cut pieces, and this  
2 is a -- a violation of claim differentiation, for one, because  
3 the claim -- the claim language does not specify how this  
4 source material image is -- is -- is formed. The compiling  
5 step and the means for compiling are not in any independent  
6 claim of the '633 patent.

7 They are only in dependent Claim 19 and dependent Claim  
8 103. Dependent Claim 19 depends from independent Claim 17.  
9 Dependent claim 103 depends from independent Claim 101. Those  
10 steps do not have the compiling step or the means for  
11 compiling.

12 So what they're -- they're doing is violating *Phillips*,  
13 415 F.3d at 1314-15, basic claim differentiation law,  
14 limitations in dependent claims are presumed not to be in  
15 independent claims and that is a --

16 **THE COURT:** Well --

17 **MR. SETH:** -- fundamental problem.

18 **THE COURT:** Okay. One quick question for you. Do  
19 you make a distinction at all between the phrases "discrete  
20 pieces" and "discrete portions"?

21 **MR. SETH:** "Discrete pieces" are -- are -- and this  
22 goes to the difference between Claim 8 and the asserted  
23 claims. The "discrete pieces" are the words in the document,  
24 and the "discrete portions" are the image of those words on  
25 the screen.

1                   **THE COURT:** Okay. Next?

2                   Yes?

3                   **MR. MARTON:** Should we move to the next term?

4                   **THE COURT:** All right. Next, I have as the lookup  
5 table.

6                   Mr. Seth, why don't you start this one?

7                   **MR. SETH:** Absolutely, Your Honor.

8                                   (Demonstrative published.)

9                   **MR. SETH:** So the -- the problem with the Zoho  
10 construction is that it ignores a couple of things. One, it  
11 ignores what one of ordinary skill in the art understands a  
12 lookup table to be, which is a data structure that contains  
13 values for searching.

14                   They propose to limit the term --

15                   **THE COURT:** It -- can I ask just a basic question?  
16 Is a dictionary a table?

17                   **MR. SETH:** A dictionary is not an electronic, first  
18 of all -- I mean, if you're talking about a physical  
19 dictionary. We're not talking about something that's on  
20 paper. We are talking about an electronic data structure for  
21 sure.

22                   And -- and it -- and it has to be structured so that you  
23 can put in a value and then obtain some additional information  
24 that is stored in the data structure and that you're looking  
25 up.

1           **THE COURT:** I -- so --

2                               (Simultaneous colloquy.)

3           **THE COURT:** We're trying to -- I mean, I -- an  
4       electronic dictionary, is that a table?

5           **MR. SETH:** An electronic dictionary would be a table  
6       if you can input something and then get out something.

7           If -- if there's -- if there's a output from the input and  
8       the output is stored in the data structure, that is a lookup  
9       table.

10          And the -- the Zoho proposed construction -- and, again,  
11       this is -- this is similar to the byte offset is it's  
12       incomplete. They say "an array or matrix," and then -- but  
13       then they don't define what an "array" is or a "matrix" is.

14          And an array, as we see --

15                               (Demonstrative published.)

16          **MR. SETH:** -- is a data structure that's -- contains  
17       a group of elements.

18          **THE COURT:** I don't have a computer science degree,  
19       but even I know what a "matrix" is.

20          **MR. SETH:** Sure. But what is an "array"?

21          **THE COURT:** Well, what's a data structure? I mean --

22          **MR. SETH:** A data structure --

23          **THE COURT:** So let me -- let me ask, is --

24                               (Simultaneous colloquy.)

25          **THE COURT:** Define a data -- under your definition,

1 define a "data structure" that's not a table. Tell me what  
2 that is.

3 **MR. SETH:** A data structure that is not a table  
4 would -- would -- would be something, for example, where  
5 you -- you have to calculate -- you put an input and then you  
6 have to calculate an output. That would not be a -- a -- that  
7 would not be a lookup table because you're not looking up  
8 something. That's in the table.

9 So there are data structures that don't have -- that  
10 have -- for -- for example, a spreadsheet is a data structure,  
11 okay, and it may -- it may not have any values in it. It may  
12 be that you input a value, and then from some equation that  
13 you've set up through cells, it will calculate a value. And  
14 calculating a value is not what a lookup table is. A lookup  
15 table is --

16 (Simultaneous colloquy.)

17 **THE COURT:** Mr. Seth.

18 **MR. SETH:** And you -- and you --

19 Let me just finish?

20 And you look up something in the data structure using  
21 something else as the input.

22 **THE COURT:** I don't -- I really don't know what your  
23 endgame here is, but I think that you have totally  
24 over-complicated this. Again, I think -- you know, you  
25 probably have some -- I haven't looked you up. You probably

1 have some advanced degree, but if I'm a juror, and I've got to  
2 define -- I have to resolve some dispute where there's a  
3 lookup table, we all have a sense of what a lookup table is.  
4 It's --

5 I mean, I use tables -- I use tables in this -- you know,  
6 for my -- I have my clerks use tables in my patent cases,  
7 right? We use tables all the time. Unless there is something  
8 that is different in the context of computer science in 1994,  
9 I don't know why we would over-complicate this. So it --

10 **MR. SETH:** Your Honor, to the --

11 **THE COURT:** And do we even need -- let me ask this as  
12 a basic question, do we really need a construction here?

13 **MR. SETH:** And -- and, you know, Your Honor, maybe --  
14 maybe we don't, given -- given what you just said. Our  
15 problem isn't -- we agree. Lookup tables are -- are not  
16 something complicated.

17 **THE COURT:** But your definition is I have to tell  
18 you. It's -- it's very -- you know, "a data structure that  
19 contains values for searching or retrieving." I mean, I --  
20 maybe you're right. I don't know -- and I'll let Mr. Marton  
21 talk here. I don't know. Maybe an array is too complicated  
22 but a matrix of data, I --

23 All right. Go ahead. Mr. Marton.

24 **MR. MARTON:** Thank you, Your Honor.

25 Mr. Seth, if I could take the screen, that would be great.

1           **MR. SETH:** Yes.

2           **THE COURT:** And tell me why I even need a -- a  
3 definition here.

4                               (Demonstrative published.)

5           **THE COURT:** Why a jury couldn't figure out what a  
6 lookup table is just by its plain meaning.

7           **MR. MARTON:** Sure. I -- I've got two things to say.  
8 One, I think we could drop the phrase "array" from this. "A  
9 matrix of data that contains values for searching." The  
10 reason I included "an array" in there was because that is how  
11 Sentius itself construed the term in the past.

12           It just seemed easier to argue consistent with what  
13 they -- they had agreed to in the past.

14           **THE COURT:** Well, and it comes from the desktop --  
15 the computer desktop encyclopedia, right?

16           **MR. MARTON:** Yes. Yes. It is an exact definition  
17 from an encyclopedia. I think it was just easier for argument  
18 sake to include the exact definition. But I agree, it is more  
19 clear saying "matrix of data that contains values for  
20 searching."

21           Now, the reason I think we need a construction is because  
22 just hearing Mr. Seth's arguments, he clearly disagrees with  
23 what a lookup table is. He thinks it's any data structure  
24 that has values for searching. So any database, any data  
25 structure, even a document itself. You just open up a

1 document, that's a data structure, and it has values that you  
2 can search.

3 That is not what everyone thinks of as a lookup table.  
4 And, you know, we have the definitions from the different  
5 dictionaries, and then we also have Figure 2.

6 (Demonstrative published.)

7 **MR. MARTON:** And Figure 2 shows us, that's a table.  
8 That's a matrix with data for searching.

9 Now, to expand that to be any data structure, which is  
10 what I think Sentius wants to do, is inconsistent with the  
11 specification -- specification and inconsistent with what one  
12 skilled in the art would understand a lookup table to be.

13 So to avoid fights down the line as to whether something  
14 in the accused product is a lookup table, I think it's safest  
15 to have a construction and -- and, frankly, I think "matrix of  
16 data that contains values for searching" would be great.

17 **MR. SETH:** Your Honor, may I respond?

18 **THE COURT:** Very briefly.

19 **MR. SETH:** I -- I just -- the -- the issue, of  
20 course, is Figure 2 shows a particular embodiment of a lookup  
21 table. And the -- it is not the only type of lookup table  
22 that there is. Not every -- not every lookup table is a  
23 matrix. It can be an array by -- by definition. And an array  
24 is a data structure is that has the values for searching,  
25 groups of elements, you could say. But I agree it may be too

1 complicated to define this.

2 **THE COURT:** All right. Let me -- I want to check in  
3 with my court reporter. We've been going an hour and a half.  
4 And we have just two more in this patent, at which point,  
5 perhaps then we can take a break. If she can unmute herself,  
6 and let me know if she can do that or she wants to take a  
7 break now.

8 (Off-the-record discussion.)

9 **THE COURT:** All right. Great. Thank you.

10 Let's do the next two, and then we'll go ahead and take  
11 break, primarily because I need to give her a break.

12 Okay.

13 So number six, "means for compiling the source material  
14 image from at least the plurality of discrete pieces."

15 (Demonstrative published.)

16 **THE COURT:** It looks like there is -- really, the big  
17 question here is indefiniteness. Let's go ahead and start  
18 with Zoho.

19 **MR. MARTON:** Thank you, Your Honor.

20 (Demonstrative published.)

21 **MR. MARTON:** So yes, the parties agree that this is a  
22 term that is subject to §112 ¶6, it is a means-plus-function  
23 term, and the parties also agree that the function is  
24 compiling the source material image from at least the  
25 plurality of discrete pieces.

1 Now, this is a -- so what we need to do is we need to look  
2 into the specification to find structure for performing this  
3 compilation step. You know, what is it that is taking the  
4 discrete pieces and turning it into an image. And the  
5 specification doesn't disclose anything doing that.

6 (Demonstrative published.)

7 **MR. MARTON:** It just recites that during the  
8 compilation -- and I'm at column 7, line 22 of the '633  
9 patent, "During the compilation, the cut text is reassembled  
10 to create an image of the text that the end-user sees."

11 And then below, that it says, "During the compile process,  
12 an image of the text is created."

13 Now, what we need here is we need an algorithm or set of  
14 steps that explains exactly how this compilation occurs.

15 (Demonstrative published.)

16 **MR. MARTON:** We don't have that. And if we look on  
17 Slide 65, what -- what we have here is Sentius's proposed  
18 structure. And they say it's a computer having a visual  
19 editor and a user interface programmed to perform the recited  
20 function and equivalents thereof.

21 They basically argue that a visual editor would be able to  
22 do this and, therefore, there needs to be no disclosure of an  
23 algorithm. But the visual editor -- and this is -- this  
24 reaches back to arguments that Sentius has been making  
25 throughout the case, that this whole case -- this whole patent

1 is about modifications to a visual editor. Well, that's  
2 fundamentally not true.

3 The patent refers to a visual editor twice -- three times  
4 if you include the figures. And a visual editor is described  
5 as doing only one thing in this patent, and that is cutting  
6 the source material into discrete pieces.

7 If you look at column 7, lines 3 through 12, it says, "the  
8 word cutting process is accomplished using a simple visual  
9 editor. For example, a point-and-click system using a  
10 pointing device such as a mouse." That is the only function  
11 that is associated with a visual editor.

12 A visual editor is not described as compiling the discrete  
13 cut pieces into an image. It has nothing to do with creating  
14 the image. There is no structure described in the patent as  
15 doing this. It is only described as something that has been  
16 done. Now, that's fine outside of a means-plus-function  
17 context. But in the means-plus-function context, there must  
18 be structure in the specification.

19 And with computer-implemented functionality, it needs to  
20 be an algorithm except in a few minor exception places from  
21 the *Katz* case. But here, you know, this is not one of those  
22 exceptions. Compilation is something that needs to be  
23 described with -- it could be a rudimentary algorithm, but  
24 there's nothing here.

25 And what Sentius points to, the visual editor or the user

1 interface, those things are not associated. They're not  
2 clearly linked with the functionality. And for that reason,  
3 we have no structure and -- this -- this term is indefinite.

4 **THE COURT:** Mr. Seth?

5 **MR. YORIO:** Your Honor, this is Mr. Yorio. I have  
6 this term for Sentius.

7 **THE COURT:** Okay. Mr. Yorio.

8 **MR. YORIO:** Could we put up Slide 61 from Sentius.

9 **MR. SETH:** I'll put that up.

10 (Demonstrative published.)

11 **MR. SETH:** Sorry.

12 **MR. YORIO:** 61.

13 **MR. SETH:** Sorry.

14 (Demonstrative published.)

15 **MR. YORIO:** In response to what Mr. Marton mentioned,  
16 there is more than sufficient corresponding structure in the  
17 patent specification with respect to visual editors and  
18 user -- graphical user interfaces.

19 Dr. Madisetti addressed that in his declaration and in his  
20 deposition. And visual editors at the time map the  
21 character's position in a document to a corresponding screen  
22 position so the visual editor can display on the screen the  
23 image of the characters.

24 And they work together to -- with the graphic uner-  
25 [phonetic] -- user interface to generate an image of the text,

1 and that is the compiling the source material image structure.

2 And I would point out that the Madisetti testimony on  
3 these issues, not disputed by Dr. Weissman on the Zoho side.

4 And with respect to the legal requirements, *Enfish* and  
5 *AllVoice* are the federal circuit cases that address what  
6 constitutes corresponding structure. You do not have to  
7 require detailed algorithm support. That's Al- -- *AllVoice*.

8 And with respect to *Enfish*, you can refer to techniques or  
9 systems or products that were known to the -- one of ordinary  
10 skill in the art at the time to support the corresponding  
11 structure.

12 And that is --

13 **THE COURT:** So --

14 **MR. YORIO:** -- exactly what *Enfish* says. And  
15 Dr. Madisetti's testimony is in line with both *Enfish* and  
16 *AllVoice*.

17 **THE COURT:** With respect to the patent itself,  
18 Mr. Yorio, can you tell me what portions of the patent  
19 specifically you rely on as the best case for linking the  
20 conversion function to the visual editors and electronic  
21 viewer modules.

22 **MR. YORIO:** The conversion function or the compiling  
23 function, Your Honor?

24 **THE COURT:** Well, do them both. What is the best --  
25 the best evidence for you in terms of a patent?

1           **MR. YORIO:** Compilation? Let me deal with -- address  
2           that first. It's on column 7 beginning with line 22. And it  
3           takes you all the way through to 49. And it takes --

4           **THE COURT:** Okay.

5           **MR. YORIO:** -- you through the compilation process at  
6           that point.

7           And the visual editor, if -- if I may, Slide 59.

8                         (Demonstrative published.)

9           **MR. YORIO:** Slide 59, Your Honor, identifies two  
10          known visual editors at the time of the patent application,  
11          the Emacs version 18.59 --

12          **THE COURT:** Okay. I don't want your PowerPoint. I  
13          just want your -- the reference in the patent itself. To the  
14          extent that it's there, your best evidence what of what's in  
15          the patent to support your position.

16          **MR. YORIO:** And all the references to visual editors  
17          in the patent would mean to one of ordinary skill in the art,  
18          visual editors like the two that are described in Slide 59.

19          It's not just --

20                         (Simultaneous colloquy.)

21          **MR. YORIO:** -- general term or --

22          **THE COURT:** You -- you're just saying the generic  
23          reference to visual editor in the patent is your answer.

24          **MR. YORIO:** No, that's the -- that's start of the  
25          answer. But "visual editor," if you are in looking at column

1 5, beginning at line 15, talks how a wordified link text  
2 database is constructed to build a wordified database, the  
3 visual editor 19 does that. And we're talking about  
4 Figure 1., which in context to that, the visual editor  
5 performs the functions that you see from line 15 to line 25.

6 **THE COURT:** Column 5? I just want the --

7 (Simultaneous colloquy.)

8 **MR. YORIO:** Column 5, line 15 to 25, Your Honor.

9 **THE COURT:** All right. I want the references 'cause  
10 I'm going to go back and look at the patent myself, so that's  
11 all I was asking for.

12 **MR. YORIO:** That's okay.

13 **THE COURT:** All right.

14 Any response, Mr. Marton?

15 **MR. MARTON:** Yes, briefly. Mr. Seth, if I could take  
16 the screen.

17 **MR. SETH:** You bet.

18 (Demonstrative published.)

19 **MR. MARTON:** So first, the -- there is -- there's  
20 been this assertion that Zoho doesn't dispute that visual  
21 editors normally perform these functions. That's just not  
22 even an issue that we've discussed or is relevant to -- to  
23 whether or not there's structure here.

24 What we do is we look at the specification. We look for  
25 structure that is linked to the particular functionality. And

1 I think Mr. Yorio's argument just highlighted that there is no  
2 link to the functionality. With regard to the compilation  
3 step, he pointed to column 7, lines 22 through 49.

4 In that section, it talks about a compilation, but it does  
5 not make any reference to -- to a visual editor. No part of  
6 this patent says that a visual editor is involved in  
7 compilation. Visual editors, as I said before, the only thing  
8 it does is cut the source material into pieces.

9 At -- the same is true --

10 (Demonstrative published.)

11 **MR. MARTON:** -- for the converting step.

12 But so I'm done with the compilation step. If we want to  
13 move on to the converting step, I can make a couple of brief  
14 arguments, but it's pretty much the same.

15 **THE COURT:** Yeah. No, that's what I was going to  
16 say. They seem to be -- again, these two terms seem to be  
17 related, so why don't you finish up your comments there, and  
18 then we can take our break.

19 **MR. MARTON:** Sure. So --

20 (Demonstrative published.)

21 **MR. MARTON:** -- with the "means for converting the  
22 display address of the selected discrete portion to an offset  
23 value from a beginning position address," there is absolutely  
24 nothing in the specification explaining structure for this.

25 (Demonstrative published.)

1           **MR. MARTON:** All we have, if we look at column 6,  
2       lines 48 through 61, is the simple statement that "the click  
3       position is determined and used to calculate an offset value  
4       within the text," so we know that a click position is  
5       determined and that's used to calculate an offset value. But  
6       we don't know how that calculation is done. There is nothing  
7       in the specification explaining what the structure is that  
8       does it.

9           Sentius's position is, well, everybody knew how to do  
10      this, so there was no need for a disclosure in -- in the  
11      specification. But that just is fundamentally inconsistent  
12      with federal circuit law.

13          We have case after case that says having failed to provide  
14      any disclosure of structural [sic] for the function, A  
15      patentee cannot rely on the knowledge of one skilled in the  
16      art to fill in the gaps. That's from *Function Media v.*  
17      *Google*, which is at 708 F.3d 310.

18          We have the *Blackboard v. Desire to Learn* case, which is  
19      at 574 F.3d 1371, that says, "A patentee cannot avoid  
20      providing sufficient specificity" -- "sufficient specificity  
21      as to the structure simply because someone of ordinary skill  
22      in the art would be able to devise a means to perform the  
23      claimed function. To allow that" -- "to allow that form of  
24      claiming under 112 ¶6 would allow the patentee to claim all  
25      possible means of achieving a function."

1           The whole point with means-plus-function claims is that  
2           the patentee is limited to the structures disclosed in the  
3           specification. And what Sentius is doing here is trying to  
4           circumvent that requirement and to say, well, anybody would  
5           know how to do it, so any way that someone would know how to  
6           do it, that's the -- that's the structure.

7           Well, that's not how this works, and these claims are  
8           indefinite.

9           **THE COURT:** All right. Mr. Yorio, a quick response  
10          given that these two terms are related at least --

11          **MR. YORIO:** Yes, Your Honor.

12          **THE COURT:** -- structure.

13          **MR. YORIO:** Thank you.

14          The cases that Mr. Marton just cited have all been  
15          discussed and distinguished in pages 14 to 15 of our response  
16          brief.

17          **THE COURT:** Okay.

18          **MR. YORIO:** And it is incorrect to say that the only  
19          structure either for compiling or converting is just the  
20          visual editor. That's a misstatement of the -- what we have  
21          listed as the structure.

22          For compiling, it's a computer having a visual editor and  
23          a user interface program to perform the recited functions.

24                               (Demonstrative published.)

25          **MR. YORIO:** And for converting, it's a computer with

1 a visual editor and an electronic viewer module program, so  
2 it's not just the visual editor alone. It is the way the  
3 visual editor and the user interface or the viewer work  
4 together.

5 And if you could show Slide 63?

6 **MR. SETH:** Is it up?

7 **THE COURT:** No, it's not.

8 **MR. SETH:** Oh.

9 (Demonstrative published.)

10 **MR. YORIO:** Slide --

11 **MR. SETH:** Now?

12 **THE COURT:** Yes, it is now.

13 **MR. SETH:** Slide 63, Your Honor, on compiling, Dr. --  
14 this is summary of Dr. Madisetti's deposition testimony on the  
15 subject of what structure is available and what visual editors  
16 meant and could do at the time of the patent application.

17 And he goes through in considerable detail that the  
18 capacity of the visual editor includes viewing, editing a  
19 document, moving a cursor, selected copying and pasting a  
20 word [sic] -- a word and that compiling a source material  
21 image is a conventional functionality of the visual editor,  
22 which is includes a viewer. You look at them together, they  
23 provide adequate constructure to one of ordinary skill in the  
24 art under *Enfish* and All Source [sic]. And Dr. Madisetti's  
25 testimony is not rebutted on the Zoho side.

1 As for converting on the same slide, converting the  
2 display address to an offset value, also a standard  
3 conventional routine function of a visual editor. And he goes  
4 on to explain how visual editors --

5 **THE COURT:** Can I ask, when you deposed  
6 Dr. Weissman -- I'm assuming you did depose him, right?

7 **MR. YORIO:** Was not deposed, but he did not submit  
8 a -- a declaration that rebutted this testimony.

9 **THE COURT:** Okay.

10 **MR. YORIO:** The next slide, 64?

11 (Demonstrative published.)

12 **MR. YORIO:** And this is Dr. Madisetti's testimony  
13 about visual editors working in conjunction with graphical  
14 user interfaces. So unlike what Mr. Marton was mentioning,  
15 just a visual editor standing alone, it's how the editor works  
16 with the user interfaces to compile the source material image.

17 And the cite there to his deposition is -- it's Document  
18 57-2, Your Honor, at pages 44 to 56. That's where the  
19 deposition testimony is there.

20 **THE COURT:** Okay.

21 **MR. YORIO:** One comment for converting, on page --  
22 Slide 69.

23 (Demonstrative published.)

24 **MR. YORIO:** This is on the "means for converting"  
25 term, Your Honor. And paragraphs -- we've highlighted

1 paragraphs -- or excuse me -- excerpts from the patent  
2 specifically talking about Figure 2 and the compile process.  
3 And the corresponding paragraphs are -- on the right-hand side  
4 are from the Madisetti declaration at Docket 51.

5 And in paragraphs 82 and 86, he describes exactly how the  
6 conversion of the display address occurs with respect to both  
7 the visual editor and its functionality at the time and the  
8 user interface, which uses -- used by the editor so that the  
9 user input -- input can be provided to indicate a location.

10 **THE COURT:** All right. It is -- you should set your  
11 clock. It is now 10:53. We'll stand in recess until 11:10.

12 **MR. YORIO:** Thank you, Your Honor.

13 **THE COURT:** And if -- if you'll take -- Mr. Seth, if  
14 you'll take that down, please. Thank you.

15 (Recess taken at 10:55 A.M.; proceedings resumed at 11:10  
16 A.M.)

17 **THE COURT:** Record will reflect that we're back in  
18 session. And it appears all the parties are here.

19 Taking a look at my notes -- and there was probably one  
20 other topic that merited a little bit of argument.

21 Just a moment.

22 (Pause in the proceedings.)

23 **THE COURT:** Trying to get all this technology to  
24 work. Just a minute.

25 Okay. So the May 1996 prosecution history remarks

1 discuss -- discuss "unique tagless linking of the invention."  
2 So if -- I guess I should have -- I should have printed this  
3 up when I was in chambers. I want to make sure I get the  
4 question right.

5 Okay. Is that a different argument from the "pure bytes  
6 offset" or not? Or how does it play into the analysis?

7 **MR. MARTON:** This is Ryan Marton. If I may address,  
8 it -- it is not a different argument than the byte offset  
9 argument.

10 So the notion in Cassorla was that it's -- relied on the  
11 file itself, information in the document itself such as tags  
12 like the -- the heading information, chapter information, for  
13 locating a relative position within the document.

14 And what Sentius was saying was, well, we don't rely on  
15 information within the document itself, tags or anything else.  
16 We rely on memory location which is independent of document  
17 format, so we're dealing with an address in a database and  
18 then byte offsets from that address in the database. And so  
19 it doesn't depend on any information in the file itself, so  
20 not the characters, not the data in the file itself, but  
21 memory.

22 So an address in a database and byte offsets from that, so  
23 it's -- it's the same argument.

24 **THE COURT:** Mr. Seth.

25 **MR. SETH:** Your Honor, it's -- yes, I -- I generally

1 agree it's -- those are related. And the -- but the -- the  
2 distinguishing feature, of course, is that we're counting from  
3 the beginning of the -- of the text, again, one byte, two byte  
4 [sic], three bytes, but counting characters from the beginning  
5 of the have text to -- to the end.

6 And -- and in this regard, I just wanted to -- I failed to  
7 mention one cite that I think it's important. It's Docket  
8 52-9, and it's the *Flyswat* claim construction order that's  
9 heavily relied on by Zoho. And at page 36 of the order, Judge  
10 Armstrong construed "pure byte offsets" and does not actually  
11 construe it as "distance in bytes," as Zoho is -- is  
12 proposing.

13 It -- her -- the definition that she adopted -- Judge  
14 Armstrong adopted was "the distance from the starting point of  
15 data structure stored in electronic storage medium."

16 And I think this just goes back to the difference between  
17 Cassorla and the '633 patent. We're measuring characters from  
18 the beginning, and we don't need some guidepost of -- of --  
19 you know, of paragraph numbers and headings and that sort  
20 of -- that sort of guidepost that's --

21 **THE COURT:** So can you have an address without a pure  
22 byte offset?

23 **MR. SETH:** Well --

24 **THE COURT:** Or can you use an address without knowing  
25 a pure byte offset?

1           **MR. SETH:** Well, you can use addresses, which are the  
2 character positions to measure the offset, which is how many  
3 characters over that you are.

4           I don't know if that's answering your question, though.

5           **THE COURT:** Mr. Marton?

6           **MR. MARTON:** No. In the context of -- of the '633,  
7 when -- when you have an address in memory and then you want  
8 to identify another address in memory as a distance from that  
9 beginning position address, you're going to use byte offsets.

10          But I mean, you obviously can have an address in memory  
11 without a byte offset. And you can have an offset -- well, I  
12 wouldn't even confuse things. I'm not going -- I'll leave it  
13 there.

14          **THE COURT:** Okay. Let's just move on.

15          **MR. MARTON:** Your Honor -- oh, I'm sorry.

16          **THE COURT:** I want to move to the '985 patent. I  
17 believe here for Zoho, we're going to be hearing from Mr. --  
18 from Mr. Haack.

19          The first disputed term, it's a series of terms with  
20 overlap. "Data objects" with the term "database" -- "data  
21 objects associated with the term database," and "data objects  
22 associated with a database."

23          Again, it looks like the first part of your constructions  
24 are identical. Zoho seems to want to add to an agreed  
25 starting point the phrase -- well, let me say, you -- you

1 agree with the following "computer readable data structures  
2 that include data from a or the term database." That's where  
3 the agreement stops.

4 Zoho wants to then include "and rules for processing the  
5 one or more documents in linking content with identified  
6 terms."

7 We'll start with Zoho on this one.

8 **MR. HAACK:** Thank you, Your Honor. If I could share  
9 my screen.

10 (Demonstrative published.)

11 **MR. HAACK:** Okay. Confirm that's up. Great.

12 So for discussing these "data objects" terms, I think it's  
13 helpful to take a look at what role did these objects play in  
14 the invention. And for that, I'm going to look briefly back  
15 to my Slide 72.

16 (Demonstrative published.)

17 **MR. HAACK:** So as we've heard in a few different  
18 environments now, the '985 invention is a little different  
19 from the '633 in that it is focused primarily on this concept  
20 of syndicating data in the form of data objects from a central  
21 database out to a remote site which the patent describes is  
22 likely to be a customer or content publisher. And that  
23 content publisher will install some additional software. It  
24 will use those database objects to parse through the pages on  
25 their website and add notations and links.

1 And the summary of the invention tells us -- that you see  
2 here on Slide 72 -- the -- the RichLink processor, that being  
3 the module that people are expected to install, downloads from  
4 the network the data structures necessary to perform  
5 high-speed tagging of the text and to execute the tagging  
6 rules. And that it then therefore performs routine  
7 synchronization of those data structures, so that changes to  
8 content within the database, tagging rules, or presentation  
9 rules are reflected locally.

10 So when the system described in the patent operates, it's  
11 fairly easy to -- to see what it's doing. Right? We have a  
12 collection of information in a database, want to get it out to  
13 a -- to a remote site. At that remote site, we need to have  
14 the ability to do a couple things, which is to see what terms  
15 are on the page. That's the Parsons step, which we'll talk  
16 about in a little bit.

17 We need to see if we have content that will map to the  
18 significant terms that come out of that parsing process. And  
19 we need to apply linking and processing rules to know where  
20 these links should go and how they should work. And that's  
21 how the invention works in a -- in a very high-level view.

22 And we see consistently throughout the specification the  
23 data objects are described in sort of two buckets. In the  
24 abstract and in the summary of the invention, they are  
25 described either as data objects or data structures at a high

1 level and described as performing the tasks or including the  
2 data I just went through.

3 You can see here, on Slide 74, where it says the RichLink  
4 processor interacts with the template objects to identify the  
5 rules that should be in process -- used in processing, and the  
6 Lexicon objects are going to identify what terms should be  
7 used in source text. Those two object types, templates and  
8 lexicon objects, those are the only two described in the  
9 patent.

10 So if we look at these particular items, we see for  
11 instance here in the abstract, the bottom data objects that  
12 represent the contents of the database and templates are  
13 syndicated to the remote servers and that they -- that it uses  
14 these to execute linking rules without requiring a connection  
15 to the database.

16 Now, all Zoho's construction is intended to capture is  
17 that the computer readable data structures, i.e., data  
18 objects, have to include the data that the invention tells us  
19 it needs to function because those are the things that get  
20 syndicated. That's these two sets of things.

21 Sentius's construction in comparison is just saying any  
22 set of data from the database will do. So I -- theirs is any  
23 subset works. Our construction says, the patent tells us in  
24 great detail we need to do multiple things, which include --  
25 and we need to have rules for those things and we need to have

1 the content that will go into those things. Our construction  
2 says, yes, that's what's in the data objects.

3 And --

4 (Demonstrative published.)

5 **MR. HAACK:** -- you'll see in Figure 7 here at  
6 Slide 78 that those are the two data types that you see coming  
7 in from the RichLink term database --

8 **THE COURT:** Let me interrupt you, Mr. Haack.

9 **MR. HAACK:** Sure.

10 Why aren't -- I mean, it appears to me that you're  
11 importing a limitation. Why are you not importing a  
12 limitation?

13 **MR. HAACK:** I think that we're not importing a  
14 limitation. We're just following the description of how the  
15 overall system works, so to -- if we -- if I could kind of  
16 answer that with a negative example. If, let's say, the data  
17 objects don't have to include any kind of rules. We're in  
18 conflict with both the sort of detailed embodiments described  
19 in the patent, as well as the higher-level generic discussions  
20 of the invention as a whole, both of which say both data and  
21 rules are the things that get syndicated from the central  
22 point out to the remote point.

23 So it's not that we're importing the limitation. It's  
24 that we're just following the limitation of how this invention  
25 performs its tasks. You need to know what you're going to

1 link and how.

2 **THE COURT:** Who's doing this one from Sentius's  
3 perspective?

4 **MR. YORIO:** Mr. Yorio, Your Honor.

5 There are two main objections that we have with the Zoho  
6 construction. One Your Honor just referenced, that they are  
7 importing a embodiment in the specification into a limitation  
8 of the term.

9 And there's also the -- they're trying to graft an  
10 additional requirement that is inconsistent with the claim  
11 language. Slide 73.

12 **MR. HAACK:** Sorry. Did you want my Slide 73?

13 **MR. YORIO:** Oh, I'm sorry. Our Slide 73.

14 **MR. HAACK:** Here, I'll drop off.

15 (Demonstrative published.)

16 **MR. YORIO:** Do you see Slide 73, Your Honor?

17 We called out the language in the claim term in Claim 1 of  
18 '985 where the "data objects" term appears. And in the  
19 syndicating element, you see how it's referenced. And there's  
20 no connection to rules for processing or linking at all.

21 Similarly, in the wherein clause, "wherein one or more  
22 data objects associated with the term 'database' provide a  
23 representation," again, no reference or connection to rules.

24 None of the claims in which database -- "data objects"  
25 appear is the rule -- word "rule" even mentioned. So that all

1 that should be required with this term is that data objects  
2 include the data or content and -- from where it's recited, is  
3 the term "database."

4 74?

5 (Demonstrative published.)

6 **MR. YORIO:** Mr. Haack mentioned the RichLink  
7 processor. That is a preferred embodiment in the patent  
8 specification, and it does -- here's the description from the  
9 patent about the RichLink processor in the summary of the  
10 invention. I think he touched upon it.

11 But as Your Honor noted, this is a preferred embodiment,  
12 and it cannot be imported into claim limitations, and that's  
13 exactly what Zoho's trying to do here.

14 One other issue, 75, there are two types of data objects  
15 in the preferred embodiment. "Data objects" is -- is a genus  
16 word, and lexicon and template objects are two examples.  
17 These are the ones that appear in the specification.

18 The parties agree that the specification describes both  
19 types and that data objects can be either lexicon objects or  
20 template objects.

21 That was raised at the technology tutorial, and that was  
22 the agreement of the experts.

23 Next slide.

24 (Demonstrative published.)

25 **MR. YORIO:** And it's only the template object that

1 contains some rules for processing and linking. And the  
2 template object appears in the '985 patent at the passage that  
3 you see on this slide. It's column 9, lines 36 to 51.

4 Next slide.

5 (Demonstrative published.)

6 **MR. YORIO:** The data object can be either in a  
7 lexicon or template, and only a template in the preferred  
8 embodiment contains rules for processing or linking. Then the  
9 proper construction of data objects cannot include such rules  
10 and the legal principle that Zoho's construction would violate  
11 is they'd be excluding the specific embodiment in the lexicon  
12 object.

13 There's another -- next slide.

14 (Demonstrative published.)

15 **MR. YORIO:** There's another issue that occurred --  
16 problem that Zoho's construction is -- and that involves claim  
17 differentiation, which they are not honoring. And I put up  
18 Claim 7 and 8. These are dependent claims, dependent on  
19 Claim 1. One is talking about a data object which is --  
20 comprises a template. And the other is a data object  
21 comprising a lexicon object.

22 And as you see in Claim 7, only Claim 7 references a rule  
23 for processing. Claim 8 doesn't have such a reference.

24 Zoho's construction would be reading out claim --  
25 dependent Claim 8, and -- and in addition, where a limitation

1 appears in a dependent claim, like it does in Claim 7, the  
2 limitation is presumed not to be present in the independent  
3 claim.

4 And that's --

5 **THE COURT:** All right. So I'm going to stop you.  
6 And -- I cutoff Mr. Haack. You want to respond to this last  
7 point?

8 **MR. HAACK:** Sure, Your Honor. I think that this --  
9 that the idea that the existence of two different kinds of  
10 data objects and their contents is only in a preferred  
11 embodiment is -- is just simply belied by the actual text of  
12 both the abstract and the summary of the invention.

13 **THE COURT:** Can I ask a clarifying questioning?

14 **MR. HAACK:** Of course.

15 **THE COURT:** Do you believe the independent claims  
16 require tagging?

17 **MR. HAACK:** That they require tagging. I think they  
18 require linking. I'd have to look back and see that they  
19 think that they require tagging. I don't believe they recite  
20 "tagging" per se.

21 Yeah.

22 **THE COURT:** So you believe that the independent  
23 claims require linking?

24 **MR. HAACK:** Yes. I think so, Your Honor.

25 For instance, Claim 1 includes the requirement that the

1 data objects are used to link the identified content with the  
2 at least one term in that final "wherein" clause.

3 **THE COURT:** Okay. With respect to the next disputed  
4 term, think we're at "lexicon objects."

5 **MR. YORIO:** Think it's "parsing," Your Honor.

6 **MR. HAACK:** Although I'm happy to do "lexicon object"  
7 along with the other data objects if you prefer, Your Honor.

8 **THE COURT:** Yeah. Why don't -- why don't we do that.

9 **MR. HAACK:** Okay.

10 (Demonstrative published.)

11 **MR. HAACK:** Okay. So "lexicon object," there's a few  
12 issues here with Sentius's proposed construction, although the  
13 parties are not particularly far apart.

14 If you see here (indicating), Sentius describes the  
15 lexicon object as a representation of content used to match  
16 terms or to create tags to assist in matching terms to  
17 content.

18 The first issue here is, you know, the parties have  
19 described a "data object" generally as a "computer readable  
20 data structure." We think it only makes sense to incorporate  
21 that agreement here to the lexicon object, which is, of  
22 course, one of the kinds of data objects that -- computer  
23 readable data structure --

24 (Off-the-record discussion in which the court stenographer  
25 requests Her Honor to instruct counsel to speak more slowly.)

1           **MR. HAACK:** I'll pick up where I was.

2           So the parties agree that a data object is a computer  
3           readable data structure. Sentius has dropped that portion of  
4           the construction of "data objects" from its construction of  
5           "lexicon object."

6           **THE COURT:** All right. I'm going to stop -- I'm  
7           going to stop you right there.

8           **MR. HAACK:** Sure.

9           **THE COURT:** That's not -- that's not a really  
10          controversial issue, is it?

11          Who's doing this one?

12          **MR. YORIO:** Mr. Yorio. I don't think it's a  
13          controversial issue.

14          **THE COURT:** Okay.

15          Keep going, then, Mr. Haack.

16          **MR. HAACK:** Thank you, Your Honor.

17          And the parties agree that the lexicon objects includes  
18          [sic] some type of data or content used to match terms. The  
19          content -- and that it might include content to create tags.

20          The key distinction here is that Sentius's proposal is to  
21          do one or to do the other. Zoho's proposal says that it is to  
22          do one and to do the other. One is open-ended. The other one  
23          says it must have both. And that --

24          **THE COURT:** Is there -- Hold on.

25          **MR. MARTON:** Um-hmm.

1           **THE COURT:** Is there any -- you also used the word  
2 "local," which is a -- is another distinction.

3           Is there any kind of real need for the use of the word  
4 "local"? Is that a point of contention between the parties?

5           **MR. HAACK:** I don't --

6                               (Simultaneous colloquy.)

7           **MR. HAACK:** Go ahead. Bob.

8           **MR. YORIO:** I'm sorry. If it was to Sentius, I don't  
9 think that whether "local" is in or not in is a material  
10 issue.

11          **THE COURT:** Okay. Thank you.

12          All right. So let's talk about the conjunctive versus  
13 disjunctive.

14          **MR. HAACK:** Okay.

15                               (Demonstrative published.)

16          **MR. HAACK:** So, Your Honor, Zoho's construction is  
17 following this description in the specification in column 9  
18 that walks us through in fairly straightforward detail what a  
19 lexicon object is.

20          It starts off, it provides a local representation of the  
21 content of the term "database." It contains data required to  
22 match terms and create tags such as a representation of the  
23 terms in that database. And it includes content for which  
24 fast access is required such as annotation content.

25          It doesn't say it might have one or more of these. It

1 says, "this is what a lexicon object is." And based on that,  
2 we see no reason to broaden it beyond the very plain  
3 straightforward description in the spec.

4 **THE COURT:** All right.

5 A response? And I think -- you know, stick -- let's stick  
6 to the crux of the dispute here, which is the conjunctive  
7 versus the disjunctive.

8 **MR. YORIO:** Right.

9 On Slide -- put our slides up on 88?

10 (Demonstrative published.)

11 **MR. YORIO:** Your Honor, Sentius does not believe that  
12 conjunctive is appropriate. It includes an unnecessary  
13 requirement into lexicon object that's inconsistent with the  
14 patent and the specification.

15 The dispute between the parties is in the second paragraph  
16 here and that Zoho says you must include additional data as  
17 well as the local representation of content. We disagree.

18 Next slide, 89.

19 (Demonstrative published.)

20 **MR. YORIO:** The -- Mr. Haack was talking about the --  
21 a paragraph in column 9. And this paragraph about "lexicon  
22 object contains," they capture the first part of the  
23 highlighted sentence, as does Sentius, but they ignore the  
24 remainder of the sentence.

25 It's the representation of the terms in the database is

1 used for matching. And that is all that you need to include  
2 for a proper construction.

3 Where you go on from that is an embodiment in the  
4 specification that should not be limited into the term. And  
5 that's what they're doing.

6 The next slide.

7 (Demonstrative published.)

8 **MR. YORIO:** And the other problem that I have with  
9 their construction in the second paragraph here is what part  
10 of the specification identifies or defines this other data?  
11 They just refer to "other data." And -- and that's in --  
12 improper, and it's -- it's indefinite.

13 The first sentence of the section of lexicon objects is  
14 what should be included in the construction.

15 And next slide.

16 (Demonstrative published.)

17 **MR. YORIO:** There's also an inconsistency on the Zoho  
18 side. They would conflict with the language and claims in 18  
19 while our Sentius construction would not.

20 And there -- what they're doing is a -- introducing  
21 additional requirement unsupported by the spec.

22 **THE COURT:** All right. Check one thing.

23 Could you bring the -- can you bring the patent slide back  
24 up, page 89?

25 (Demonstrative published.)

1           **THE COURT:** What -- ask this: The phrase "such as",  
2 what, if any, relevance do you place on those words with  
3 respect to your arguments in the highlighted portion?

4           **MR. YORIO:** Is that to Sentius?

5           **THE COURT:** It's to both of you.

6           **MR. YORIO:** Okay.

7           The way I read that is it's an example of what the lexicon  
8 object contains and, hence, the word "such as," a  
9 representation of the terms in the database. And I think  
10 that's in both parties' constructions.

11           And then the other -- the rest of that sentence, "optimize  
12 for fast matching by the RichLink processor," et cetera, that  
13 is just an embodiment. And that -- that preferred embodiment  
14 should not be imported into the claims.

15           **THE COURT:** All right.

16           **MR. YORIO:** -- clearly is an example.

17           **THE COURT:** Mr. Haack.

18           **MR. HAACK:** Yeah, Your Honor, as you -- as you may  
19 suspect, I take the contrary view, right?

20           I read that sentence as saying very definitively, the  
21 lexicon object contains data required to, one, match terms,  
22 and, two, create tags. And that's why our construction says  
23 it's content to match terms and create tags.

24           And then the rest of it is the part that is potentially  
25 optional, right? Such as a representation of terms in the

1 database on which these things have been processed, you know,  
2 optimize for fast matching, and so on.

3 **THE COURT:** Okay. We don't have much time left.

4 "Parsing."

5 **MR. HAACK:** Do you have a preference on who starts  
6 that, Your Honor?

7 **THE COURT:** Well, let's go ahead and start with you  
8 again, Mr. Haack, because, again, you're seeking to achieve a  
9 definition that is much more complex than that of Sentius.

10 (Demonstrative published.)

11 **MR. HAACK:** Sure, Your Honor.

12 Okay. So have the parsing slides up, I hope.

13 You'll see here there are two terms here. The differences  
14 are minor in that the phrase in Claim 21 includes "source  
15 documents" and "predetermined rules" --

16 **THE COURT:** So, Mr. Haack, what kind of device are  
17 you using to speak?

18 **MR. HAACK:** I have a headset on.

19 **THE COURT:** All right. So I agree with the court  
20 reporter, you go in and out.

21 **MR. HAACK:** Here -- Your Honor, could you give me one  
22 second. I have another device I can plug it into and see if  
23 it's any better. I'll do that right now.

24 (Pause in the proceedings.)

25 **MR. HAACK:** Is that better?

1           **THE COURT:** I think so. Try it. Let's try it.

2           **MR. HAACK:** Okay.

3           All right. I'll continue like this, and let me know if  
4           it's a problem. I apologize for that.

5           **THE COURT:** That's all right.

6           **MR. HAACK:** So we are here at the -- the distinction  
7           between these two terms is small. The second phrase from  
8           Claim 21 includes just that the rules are predetermined and  
9           refers to the documents as source documents.

10          Now, the reason that Zoho's construction includes more  
11          sort of features than Sentius's -- Sentius's proposal is  
12          because it follows what the spec tells us about the parsing  
13          process in the '95 patent.

14          "Parsing" is mentioned in only a couple locations in the  
15          patent. And where it is mentioned, it is described at a very  
16          high level. So, for instance, here, in the summary of the  
17          invention, it simply says, "Term identification may be  
18          accomplished by crawling and parsing." They don't tell us  
19          what they're doing when they're doing that parsing.

20          In Figure 6, there's a little more information where it  
21          says that files matching certain types are parsed using  
22          natural language processing to tokenize the text into  
23          significant objects such as words and phrases.

24          And the parties agree that that is essentially part of the  
25          process. When they say, segmenting, right? "Tokenizing"

1 means breaking a natural language input into smaller chunks,  
2 into tokens that can be processed, so hence the agreed portion  
3 of the construction segmenting.

4 And -- but this sentence goes on. It does not stop at  
5 significant words and phrases. And it says, "until a full  
6 index of all words and phrases on the site is created," and  
7 then, "from this full index," moving to Slide 85, "Terms of  
8 interest are chosen using a set of rules."

9 And so our construction --

10 (Demonstrative published.)

11 **MR. HAACK:** -- is based on the only place in the  
12 patent that tells us what the patent means when it says  
13 there's a parsing process. And that is to say, we tokenize  
14 it, i.e., segment it into significant objects that is used to  
15 create a full index of all words and phrases on the site. And  
16 that index is the -- the set from which terms of interest are  
17 selected using a -- a set of rules. It's really very  
18 straightforward.

19 Sentius's construction essentially takes by saying --  
20 breaking down one or more documents into segments and to  
21 identify a term based on a rule, they take -- whoops, I'm  
22 sorry -- back on Slide 84 -- essentially would like to take  
23 the first highlighted sentence, the second highlighted  
24 sentence, and then skip the next part of that highlighted  
25 line, skip the last part of the sentence, and add part of the

1 next sentence.

2 They just want to delete this line that says, "until a  
3 full index is created."

4 **THE COURT:** Well, Mr. Yorio, are you doing this one  
5 as well?

6 **MR. YORIO:** I am, Your Honor.

7 **THE COURT:** All right.

8 **MR. YORIO:** If you could --

9 **THE COURT:** So --

10 **MR. YORIO:** Go ahead, Your Honor.

11 **THE COURT:** Mr. Haack, if you'll take that down.

12 I mean, as I look at what is being recommended by Sentius,  
13 you really haven't defined too much. I mean, we've got a  
14 disputed term and, really, the only definition that you're  
15 suggesting here is to define "parsing one or more  
16 documents" --

17 (Demonstrative published.)

18 **THE COURT:** -- to be "breaking one or more documents  
19 into segments." I mean, the rest is just a recitation of the  
20 rest of the term.

21 **MR. YORIO:** Well, Your Honor, I -- I think the term  
22 really -- and I -- I mean, the phrase is one that Zoho  
23 proposed. But from Sentius's point of view, the term is  
24 "parsing." And "parsing" is breaking one or more documents  
25 into segments, and both parties agree. It's a basic

1 functionality in any visual editor.

2 What they are trying to do is to take language where  
3 "parsing" appears and graft that onto a longer phrase. And I  
4 don't think that's proper because what it -- what they're  
5 really trying to do is import a preferred embodiment from the  
6 spec into the claim language.

7 Let me show you 81. Slide 81.

8 (Demonstrative published.)

9 **MR. YORIO:** So the text at -- and you see in the  
10 middle, Your Honor, at column 6, 57, 60, this was the sentence  
11 in Mr. Haack's slide that he contended Sentius was ignoring.  
12 I don't agree with that. I think Zoho is misreading it.

13 What that sentence says is that "Files matching the  
14 specified types are parsed using natural language processing,"  
15 et cetera, "until a full index of words and phrases on the  
16 site is created." So it's a timing mechanism. It isn't --  
17 you don't incorporate a full index into "parsing."

18 So -- as I mention in the next paragraph, what they're  
19 trying to take any part of the process in this embodiment and  
20 automatically add it to the construction.

21 Next slide. The word -- the key word in the last sentence  
22 on column 6 is "until." And Mr. -- Dr. Madisetti addressed in  
23 at paragraph 96 of his declaration. That's Docket 51.

24 But in the middle of the -- of the slide here, the parsing  
25 continues until such time as the full index of all words and

1 phrases on the site is created.

2 It's talking about continuing until a particular event  
3 occurs. Zoho pays short shrift to the word "until," and they  
4 just want you to go to "index." It's not proper.

5 And 80 -- Slide 83 --

6 (Demonstrative published.)

7 **MR. YORIO:** -- describes the claim construction  
8 principle that the Zoho construction would violate.

9 They're trying to exclude a preferred embodiment which is  
10 rarely ever correct under long-standing claim construction  
11 principles.

12 **THE COURT:** All right. I think I understand the  
13 argument.

14 Okay. I, unlike some of my colleagues, do not rule from  
15 the bench on claim construction unless I have some wonderful  
16 idea that I can get the parties to all agree on, in which case  
17 we agree on that and we move on.

18 I hope to have something out, you know, in the  
19 not-too-far-distant future. I have a good understanding of  
20 what the issues are.

21 Is there anything else you want to say before we close  
22 down for the day?

23 From Zoho? Mr. Marton?

24 **MR. MARTON:** I have nothing further, Your Honor.  
25 Thank you.

1           **THE COURT:** Okay. From Sentius?

2           **MR. SETH:** Nothing further, Your Honor.

3           **THE COURT:** All right.

4           Okay. Then everybody have a good weekend. We're  
5 adjourned. Thank you very much.

6           **MR. SETH:** Thank you, Your Honor.

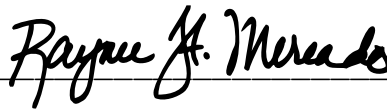

7           **MR. HAACK:** Thank you, Your Honor.

8           (Proceedings were concluded at 11:51 A.M.)

9                               --o0o--

10  
11  
12                               **CERTIFICATE OF REPORTER**

13  
14           I certify that the foregoing is a correct transcript  
15 from the record of proceedings in the above-entitled matter.  
16 I further certify that I am neither counsel for, related to,  
17 nor employed by any of the parties to the action in which this  
18 hearing was taken, and further that I am not financially nor  
19 otherwise interested in the outcome of the action.
